(An example of “supervised learning” - more in a few slides!)

## The ML Approach

TRUE

FALSE

FALSE

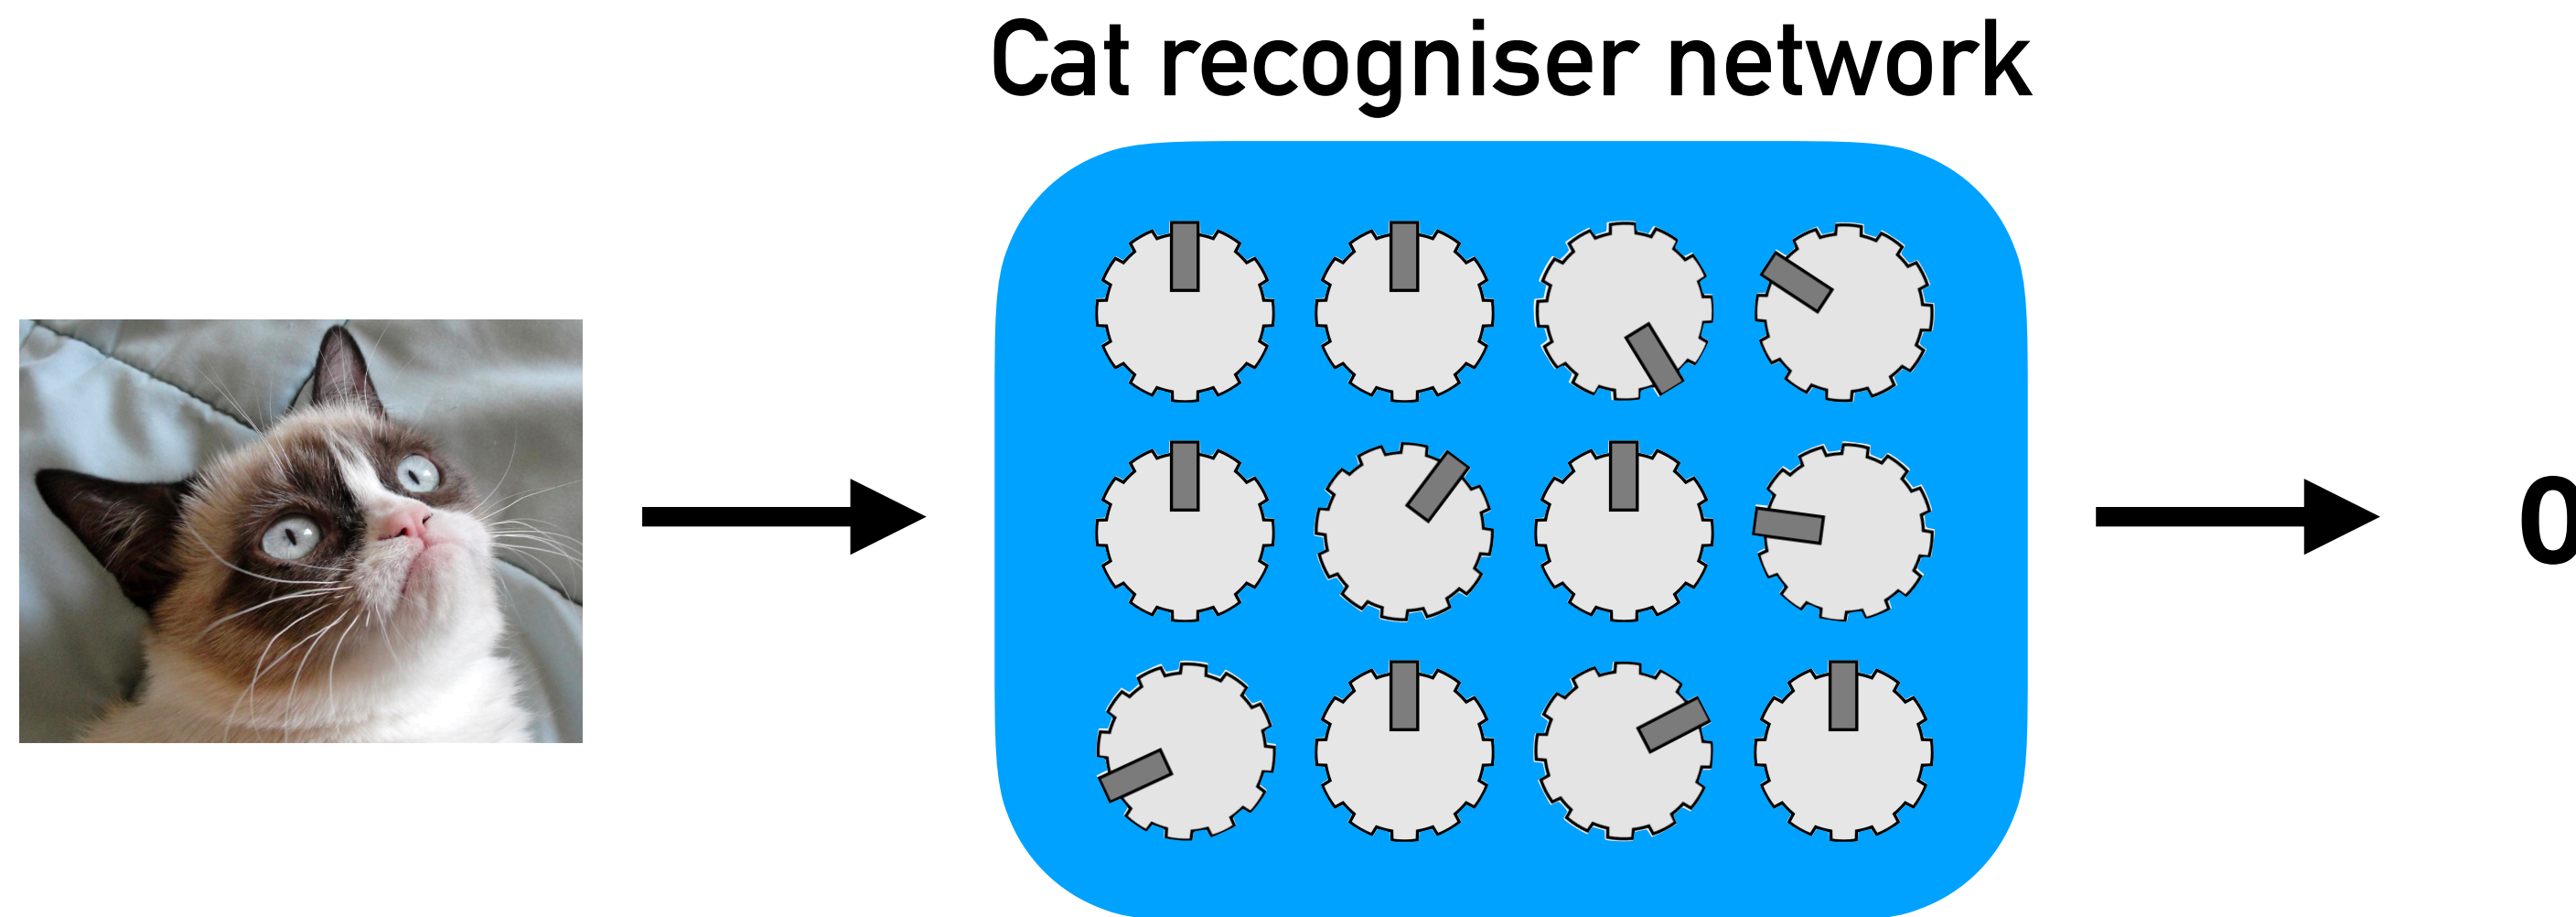

TRUE

## The Human Approach

```
FUNCTION IS_CAT?:  
  IF( HAS_WHISKERS ):  
    IF( HAS_CAT_EYES ):  
      IF( HAS_NO_MANE ):  
        IF( . . . ):  
          RETURN TRUE  
    ELSE:  
      RETURN FALSE
```

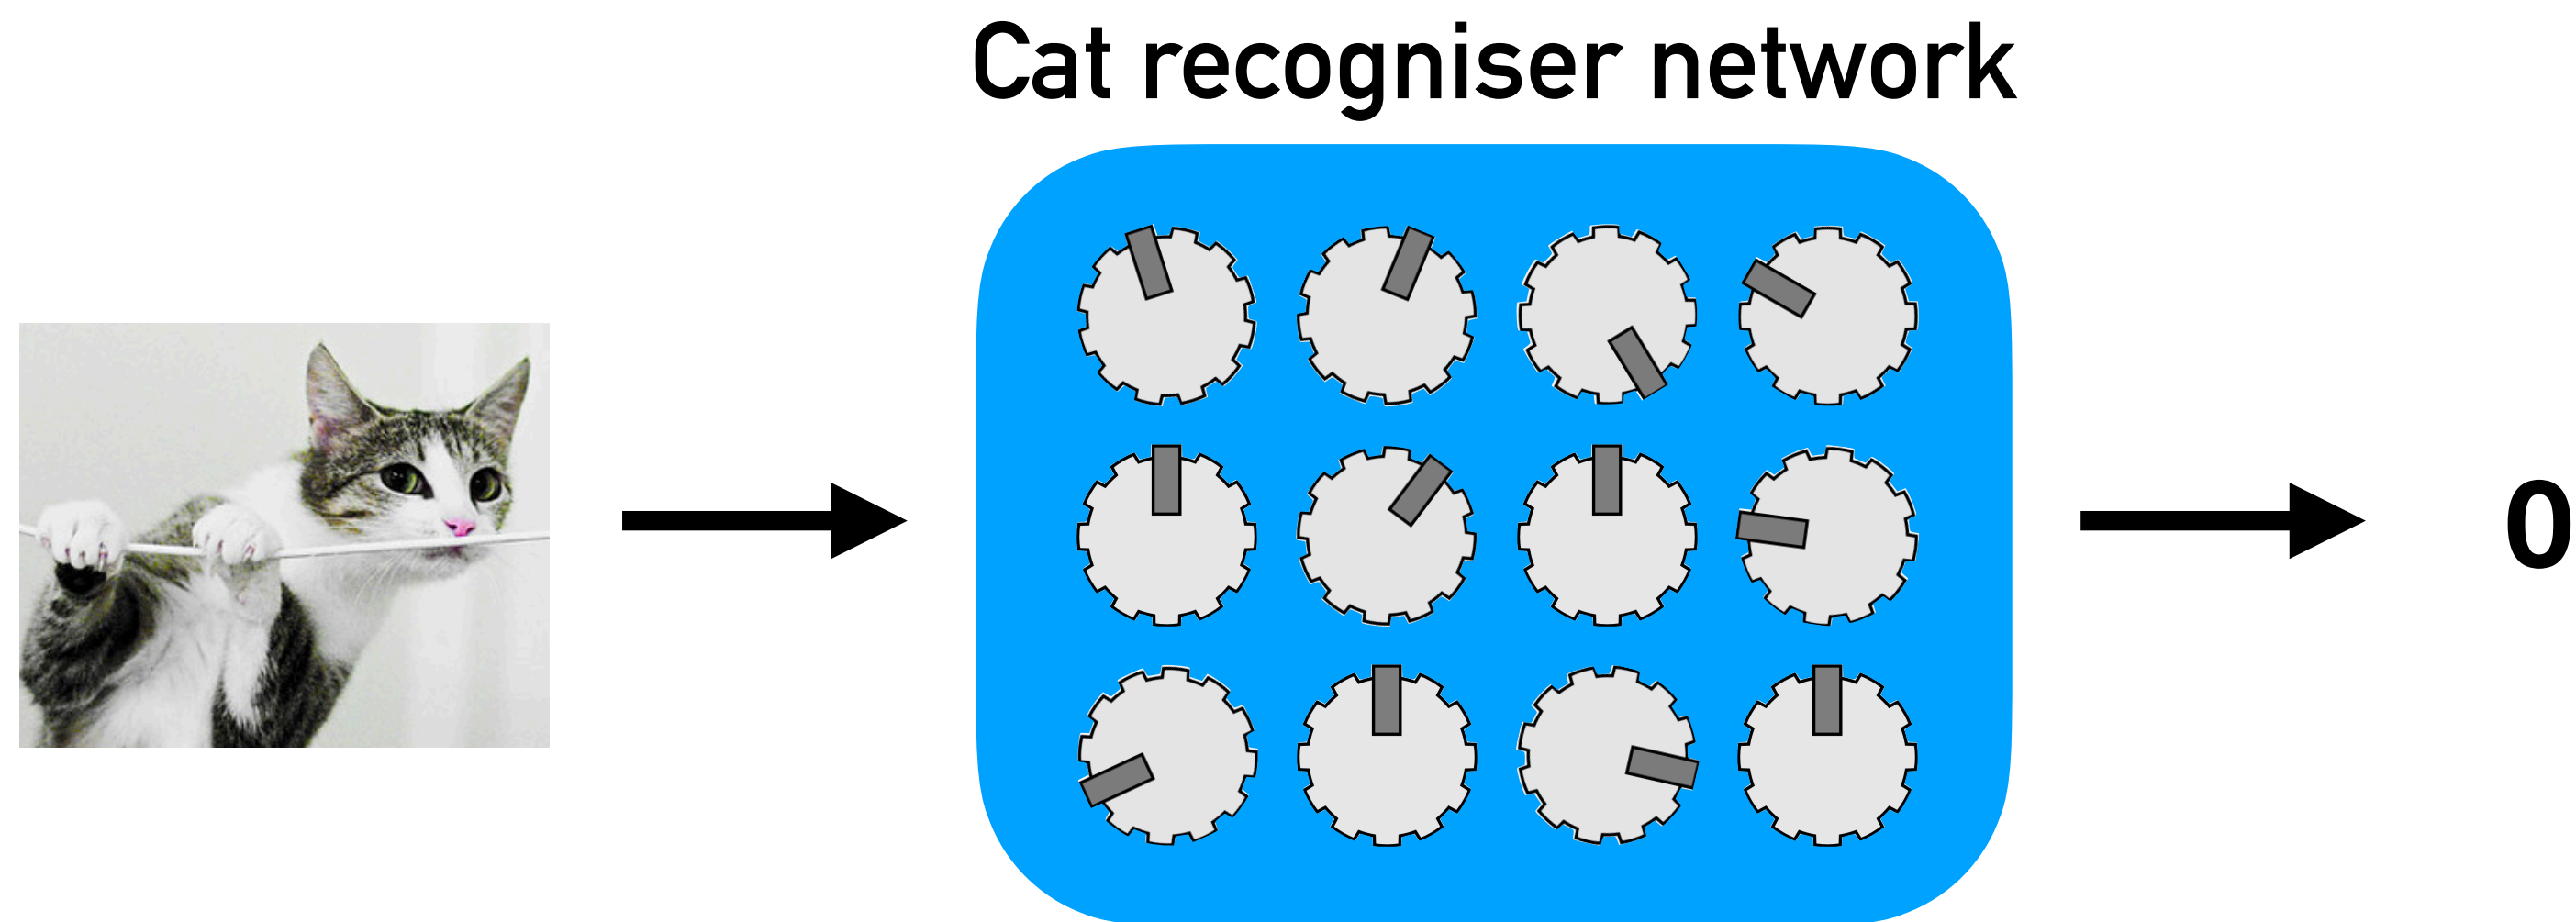

The **main component** in many ML techniques is a **neural network**

The **main component** in many ML techniques is a **neural network**

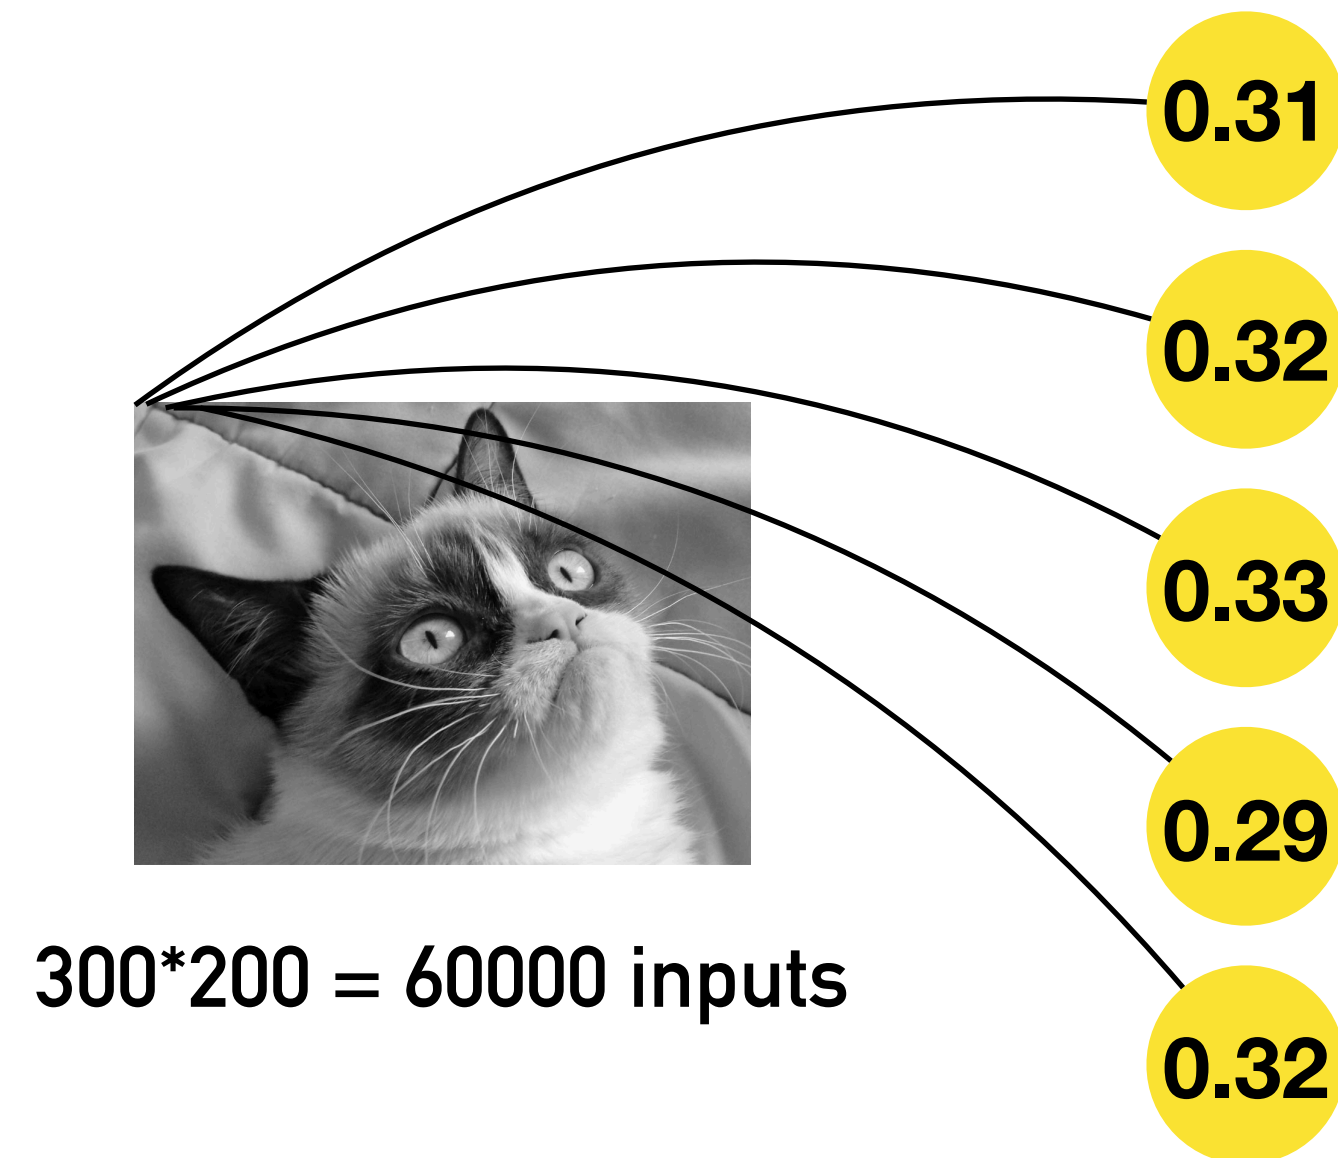

# The **main component** in many ML techniques is a **neural network**

Repeat for all cats, tweaking the knobs so that we recognize all of them!

This is **'learning'**

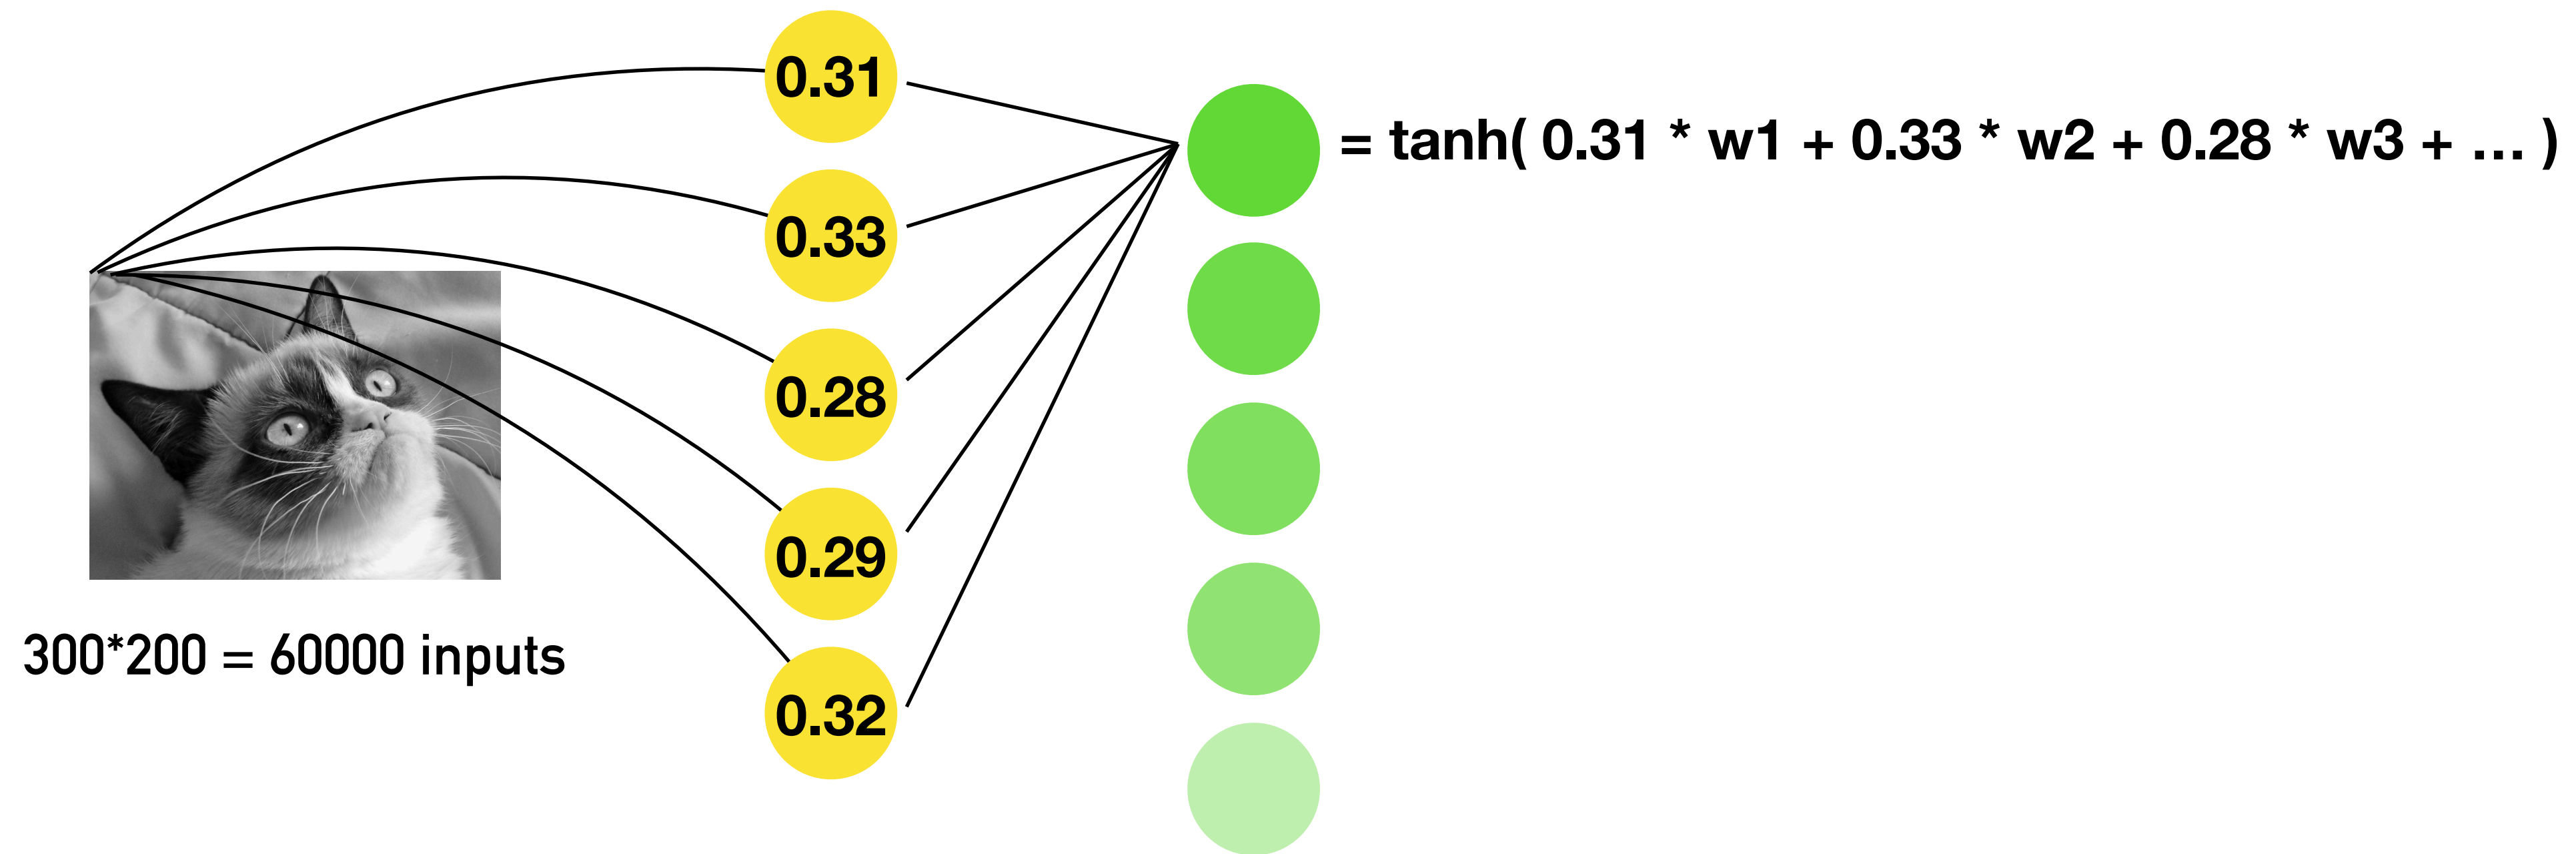

# This is how a simple NN works

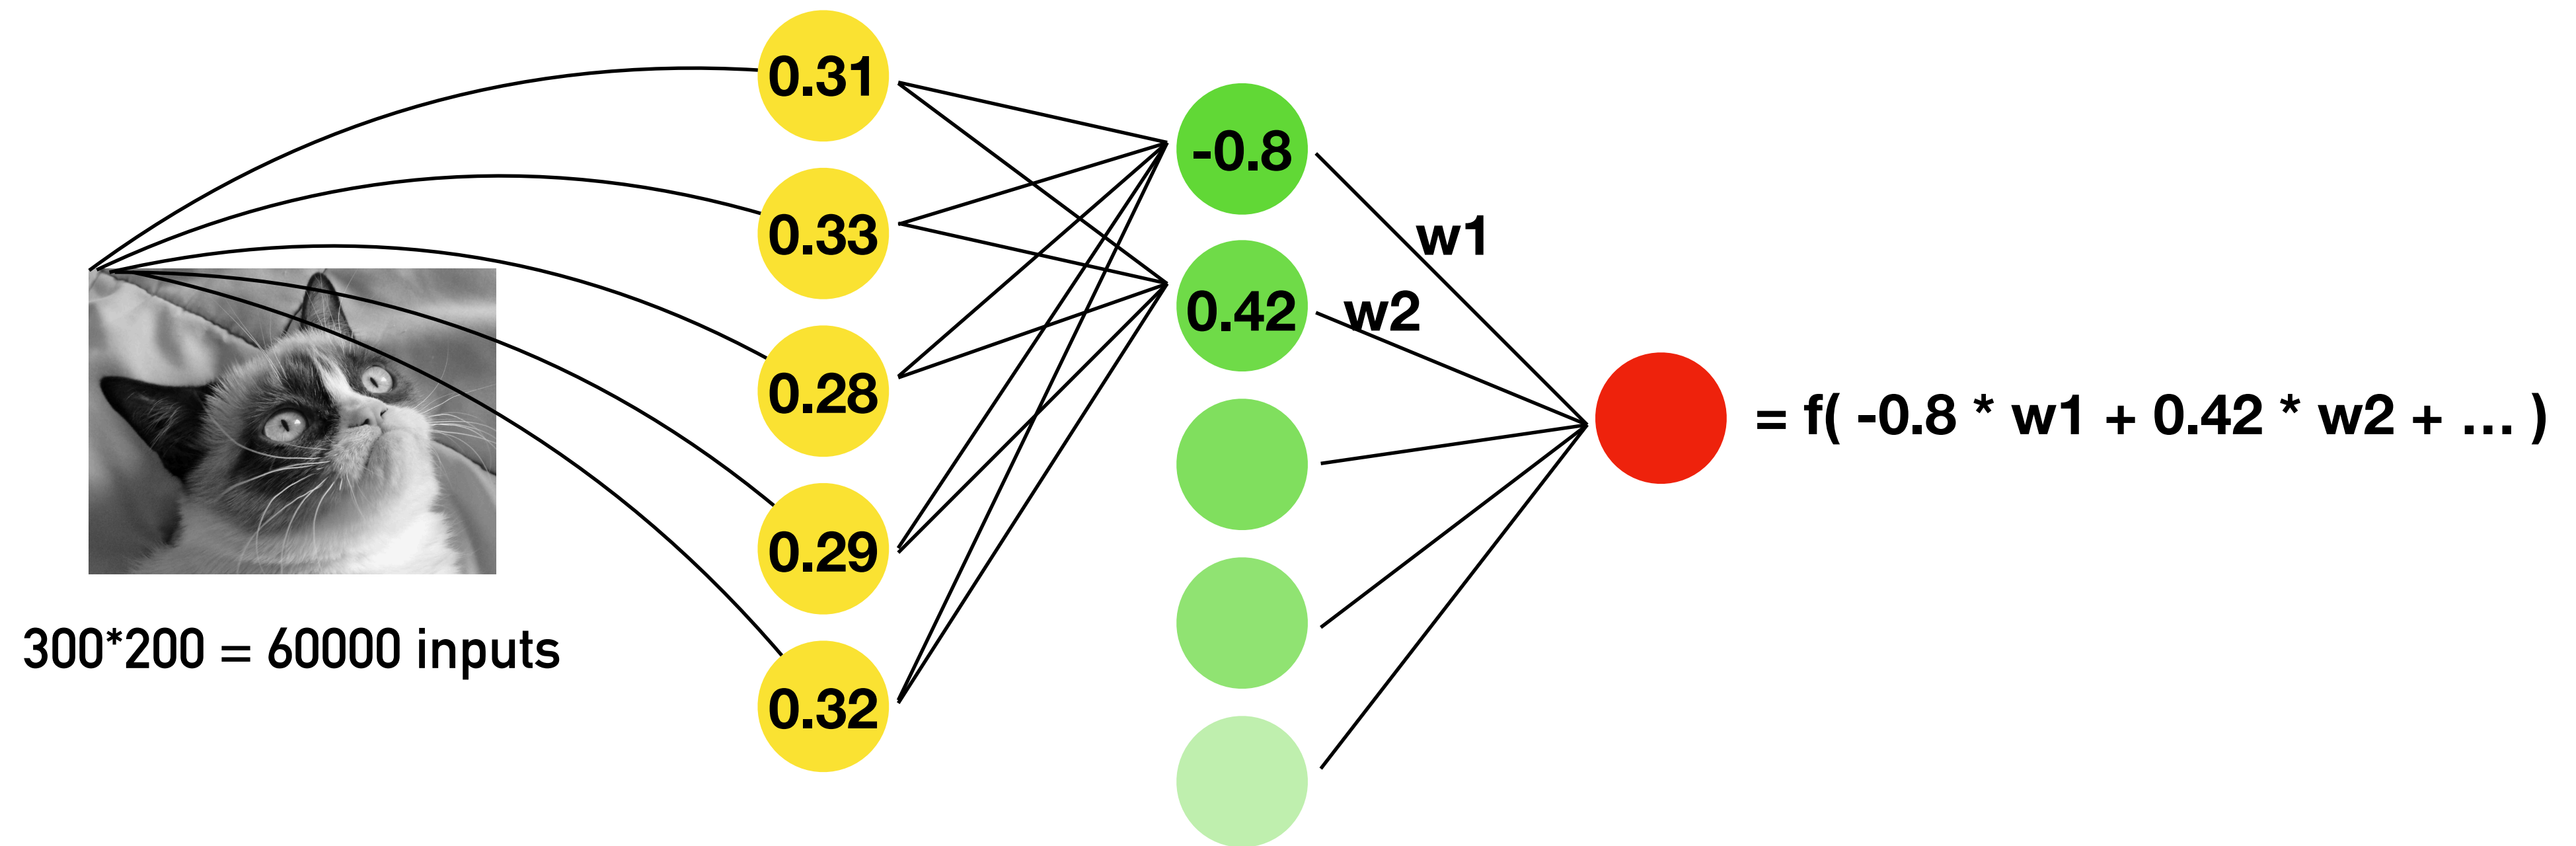

# This is how a simple NN works

# This is how a simple NN works

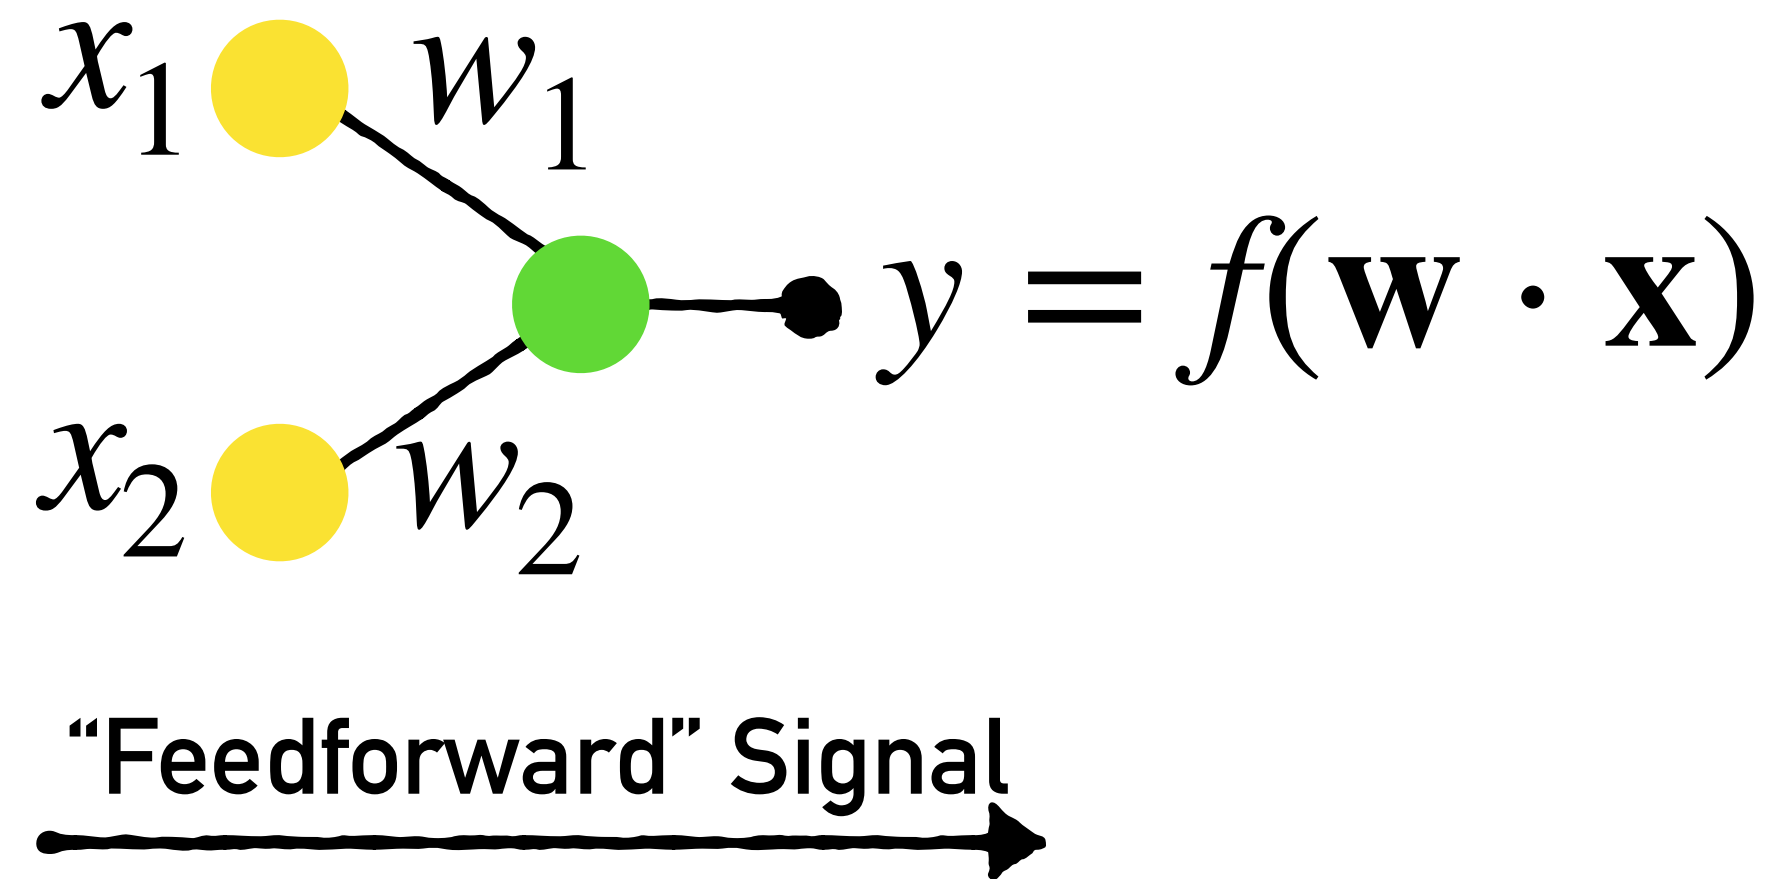

# This is how a simple NN works

The knobs from before are the w's (the **weights**)

# This is the entire essence of (artificial) neural networks

## A Single Neuron

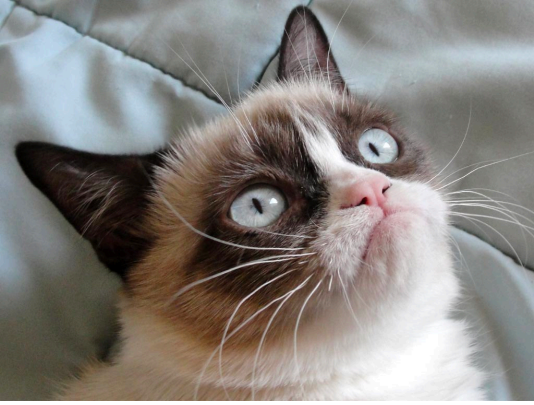

## A Neural Network

A Neural Network is a highly non-linear, parameterised function  $y(\mathbf{x}, \{\mathbf{w}\})$

# Learning = updating the weights to **minimise the loss-function**

Input	Answer/Target	Network Prediction	Network Prediction
	1	0	1
	0	1	0
	1	0	1
	0	1	0

Error: 4

Error: 0

$$\mathcal{L} \sim \sum (y_{true} - y_{predicted})^2$$

Can be changed with the weights/knobs!

# A **workflow** for neural networks looks like this:

Step 1 **Given:** A dataset with many **inputs**  $\mathbf{x}$  and corresponding **outputs**  $y_{\text{true}}(\mathbf{x})$

Step 2

$$\mathcal{L}(\mathbf{w}, \{\mathbf{x}\}) = \sum_{\mathbf{x} \in \{\mathbf{x}\}} \left( y_{\text{true}}(\mathbf{x}) - y_{\text{network}}(\mathbf{w}, \mathbf{x}) \right)^2$$

Gradient Descent / **Backpropagation**  $\mathbf{w} \rightarrow \mathbf{w} - \nabla_{\mathbf{w}} \mathcal{L}$

Step 3 **Generalize.** Use the network to infer (predict) the right output for new inputs

# Neural Networks come in many **topologies**

<https://www.asimovinstitute.org/neural-network-zoo/>

Deep Feed Forward (DFF)

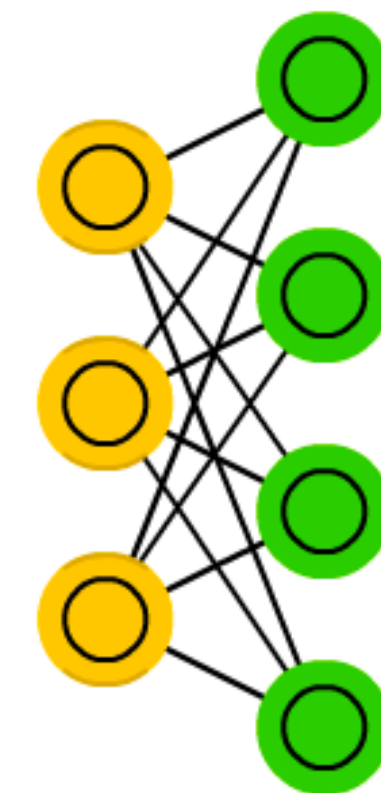

Auto Encoder (AE)

Output = Input

Restricted BM (RBM)

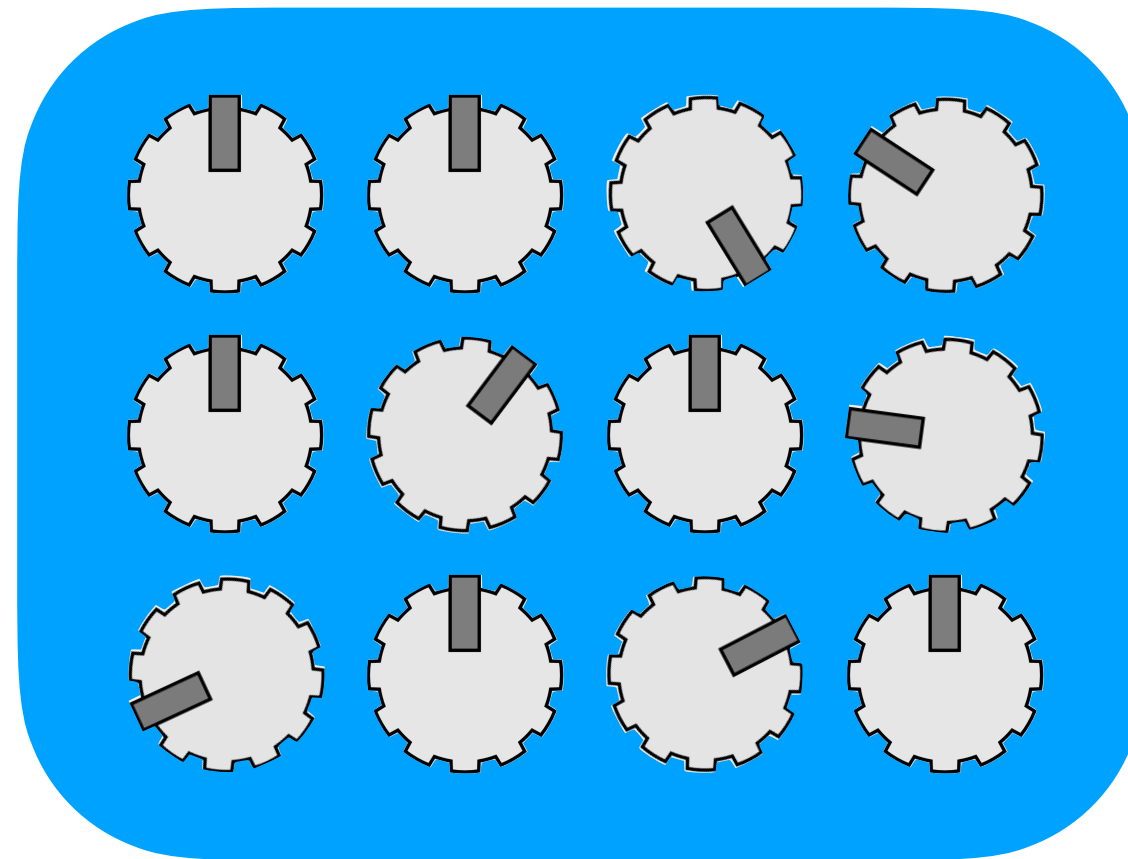

Good at learning  $p(\mathbf{x})$

“Distance” between prob. distributions

# A quick **summary**

A Neural Network is a machine with many parameters (knobs), that we can tune (train) so that it reproduces the answers we want

Given **enough** parameters, we can **fit any function** we want

(For example, we can fit the 'is\_this\_a\_cat?' function)  
(Or, we can fit a 'turn\_random\_noise\_into\_a\_face' function)  
(... etc)

# There are roughly three types of ML

## Supervised Learning

Learning from examples

$$\{x_1, y_1\} = \left\{ \begin{array}{c} \text{[Cat Image]} \\ \text{, } 1 \end{array} \right\}$$
$$\{x_2, y_2\} = \left\{ \begin{array}{c} \text{[Dog Image]} \\ \text{, } 0 \end{array} \right\}$$

Learn  $p(y | x)$

Classification

## Unsupervised Learning

Learning about examples

$$x_1 = \text{[Cat Image]}$$
$$x_2 = \text{[Cat Image]}$$

Learn  $p(x)$

(Draw samples to generate!)

## Reinforcement Learning

Learning from feedback

Learn a **policy**,  
(best action in a given state  $s$ )

Learn  $\pi(s)$

Sutton&Barto

# Each of these types has a use in physics

## Supervised Learning

Learning from examples

Picture of a galaxy -> which type?

LHC collisions -> which particles?  
LHC -> interesting collision?

Material -> superconductor?

Learn  $p(y | x)$

Classification

## Unsupervised Learning

Learning about examples

Generate more superconductors?

Run EXPERIMENTS!

Learn  $p(x)$

(Draw samples to generate!)

## Reinforcement Learning

Learning from feedback

Correct errors in a quantum computer

Control EXPERIMENTS!

Learn  $\pi(s)$

Sutton&Barto

# Condensed Matter Physics

Studies properties of matter

How well does a piece of metal conduct?

Why are metals shiny?

How do superconductors work?

How does an insulator work?

How do we make a quantum computer?

At what temperature does a magnet stop working?

...

# This is how we use ML for Quantum Physics

## Supervised Learning

## Unsupervised Learning

Wavefunction Neural Network

Quantum State Reconstruction

$$\Psi =$$

## Reinforcement Learning

Correcting a quantum computer

Controlling experiments

# This is how we use ML for Quantum Physics

## Supervised Learning

### Finding Phase Transitions

### Enhancing experiments

# Supervised learning can be used to find **phase transitions**

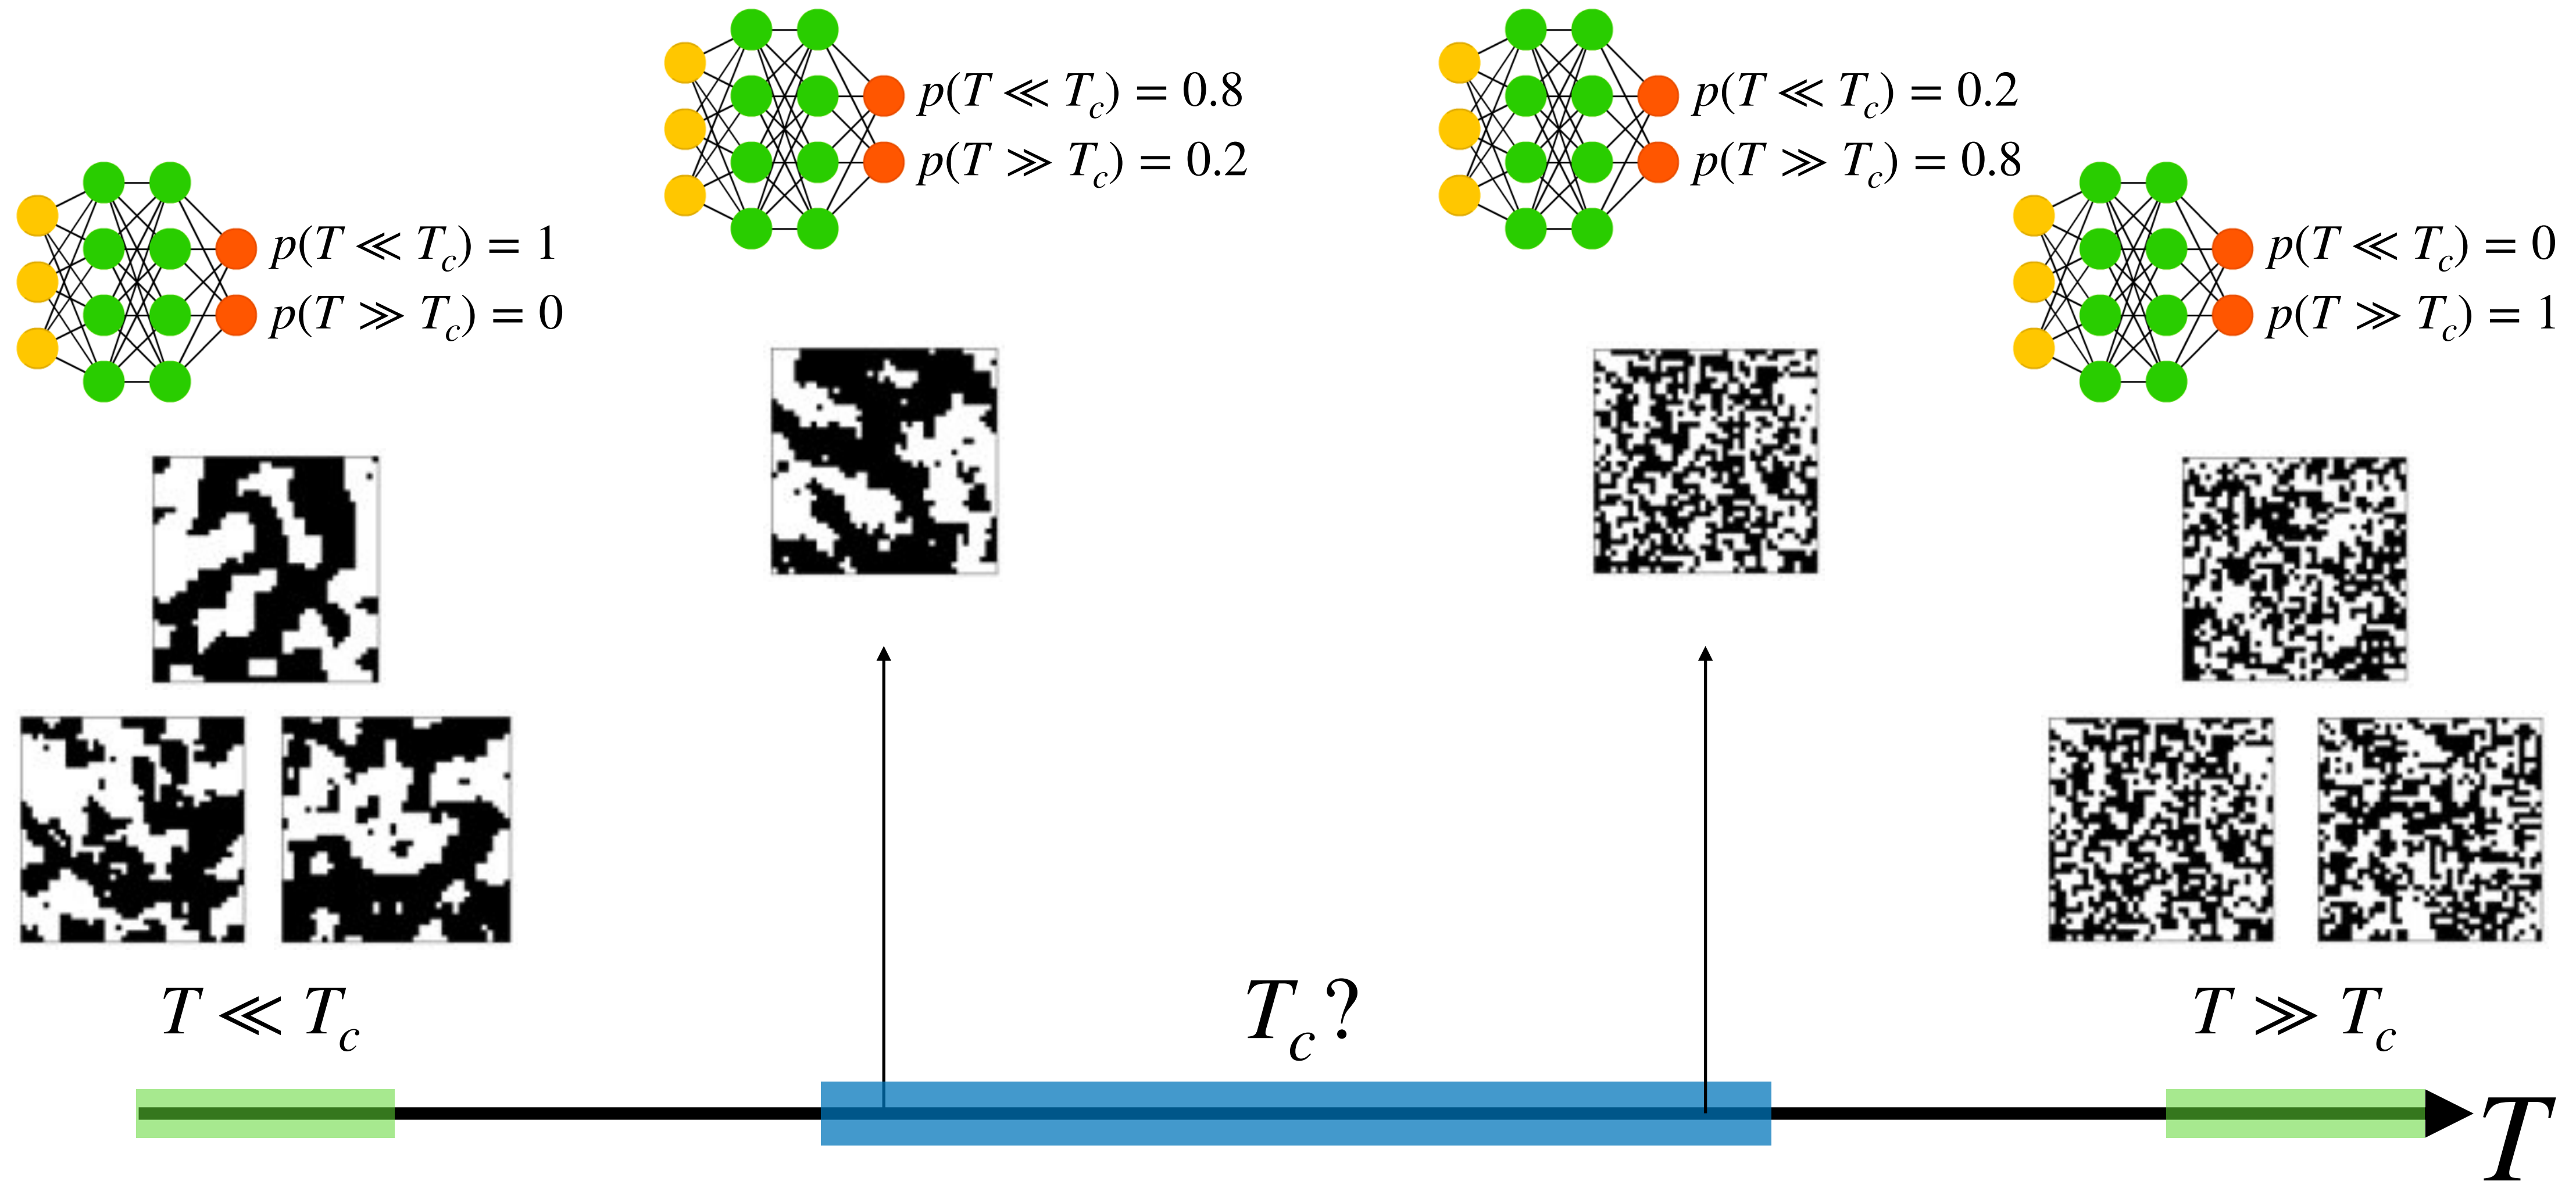

$T \ll T_c$

$T_c?$

$T \gg T_c$

# Supervised learning can be used to find phase transitions

# Supervised learning can be used to find phase transitions

$$p(T \gg T_c) = 0$$

$$T \ll T_c$$

$$T_c?$$

$$T \gg T_c$$

# Supervised learning can **make some experiments 100x faster**

At QDev, Ferdinand Kuemmeth works on **qubits**

Quantum bit: can be part 0 and part 1 simultaneously

Reading out the qubit state: electric signals

The signal is then demodulated using techniques that are rooted in old radio-technology

Takes 10-100 **microseconds!**

Raw data -> ~100 **nanoseconds!**

# This is how we use ML for Quantum Physics

## Supervised Learning

Finding Phase Transitions

Enhancing experiments

## Unsupervised Learning

Wavefunction Neural Network

Quantum State Reconstruction

$$\Psi =$$

# Unsupervised learning can do Quantum State Reconstruction

An experiment with 4 two-level atoms (each can be in quantum state 0 or 1)

The full system can be a superposition of all 16 possible states

0 0 0 0  
0 0 0 1  
0 0 1 0  
0 0 1 1  
...

The full state of this system is called the **wavefunction**

$$\Psi(a_1, a_2, a_3, a_4)$$

# Unsupervised learning can do Quantum State Reconstruction

An experiment with 4 two-level atoms (each can be in quantum state 0 or 1)

Perform the experiment many times, and record which configuration we get

0 1 0 1  
1 1 0 1  
1 0 0 1  
0 1 0 1  
0 1 0 1

**Projective measurements**  
Every time we look, we force the atoms  
to choose; Schrödingers cat

Question: can we learn  $\Psi(a_1, a_2, a_3, a_4)$ ?

# Unsupervised learning can do Quantum State Reconstruction

Histogram does not scale!  
**Exponential number of measurements!**

$2^4 = 16$      $2^{64} >$  grains of sand on earth

$\Psi =$

Trade a complex (impossible) measurement for many simple ones

# This is how we use ML for Quantum Physics

## Supervised Learning

Finding Phase Transitions

Enhancing experiments

## Unsupervised Learning

Wavefunction Neural Network

Quantum State Reconstruction

$$\Psi =$$

## Reinforcement Learning

Correcting a quantum computer

Controlling experiments

# Reinforcement learning is about **strategies (policies)**

MuZero (the successor to AlphaZero and AlphaGo)

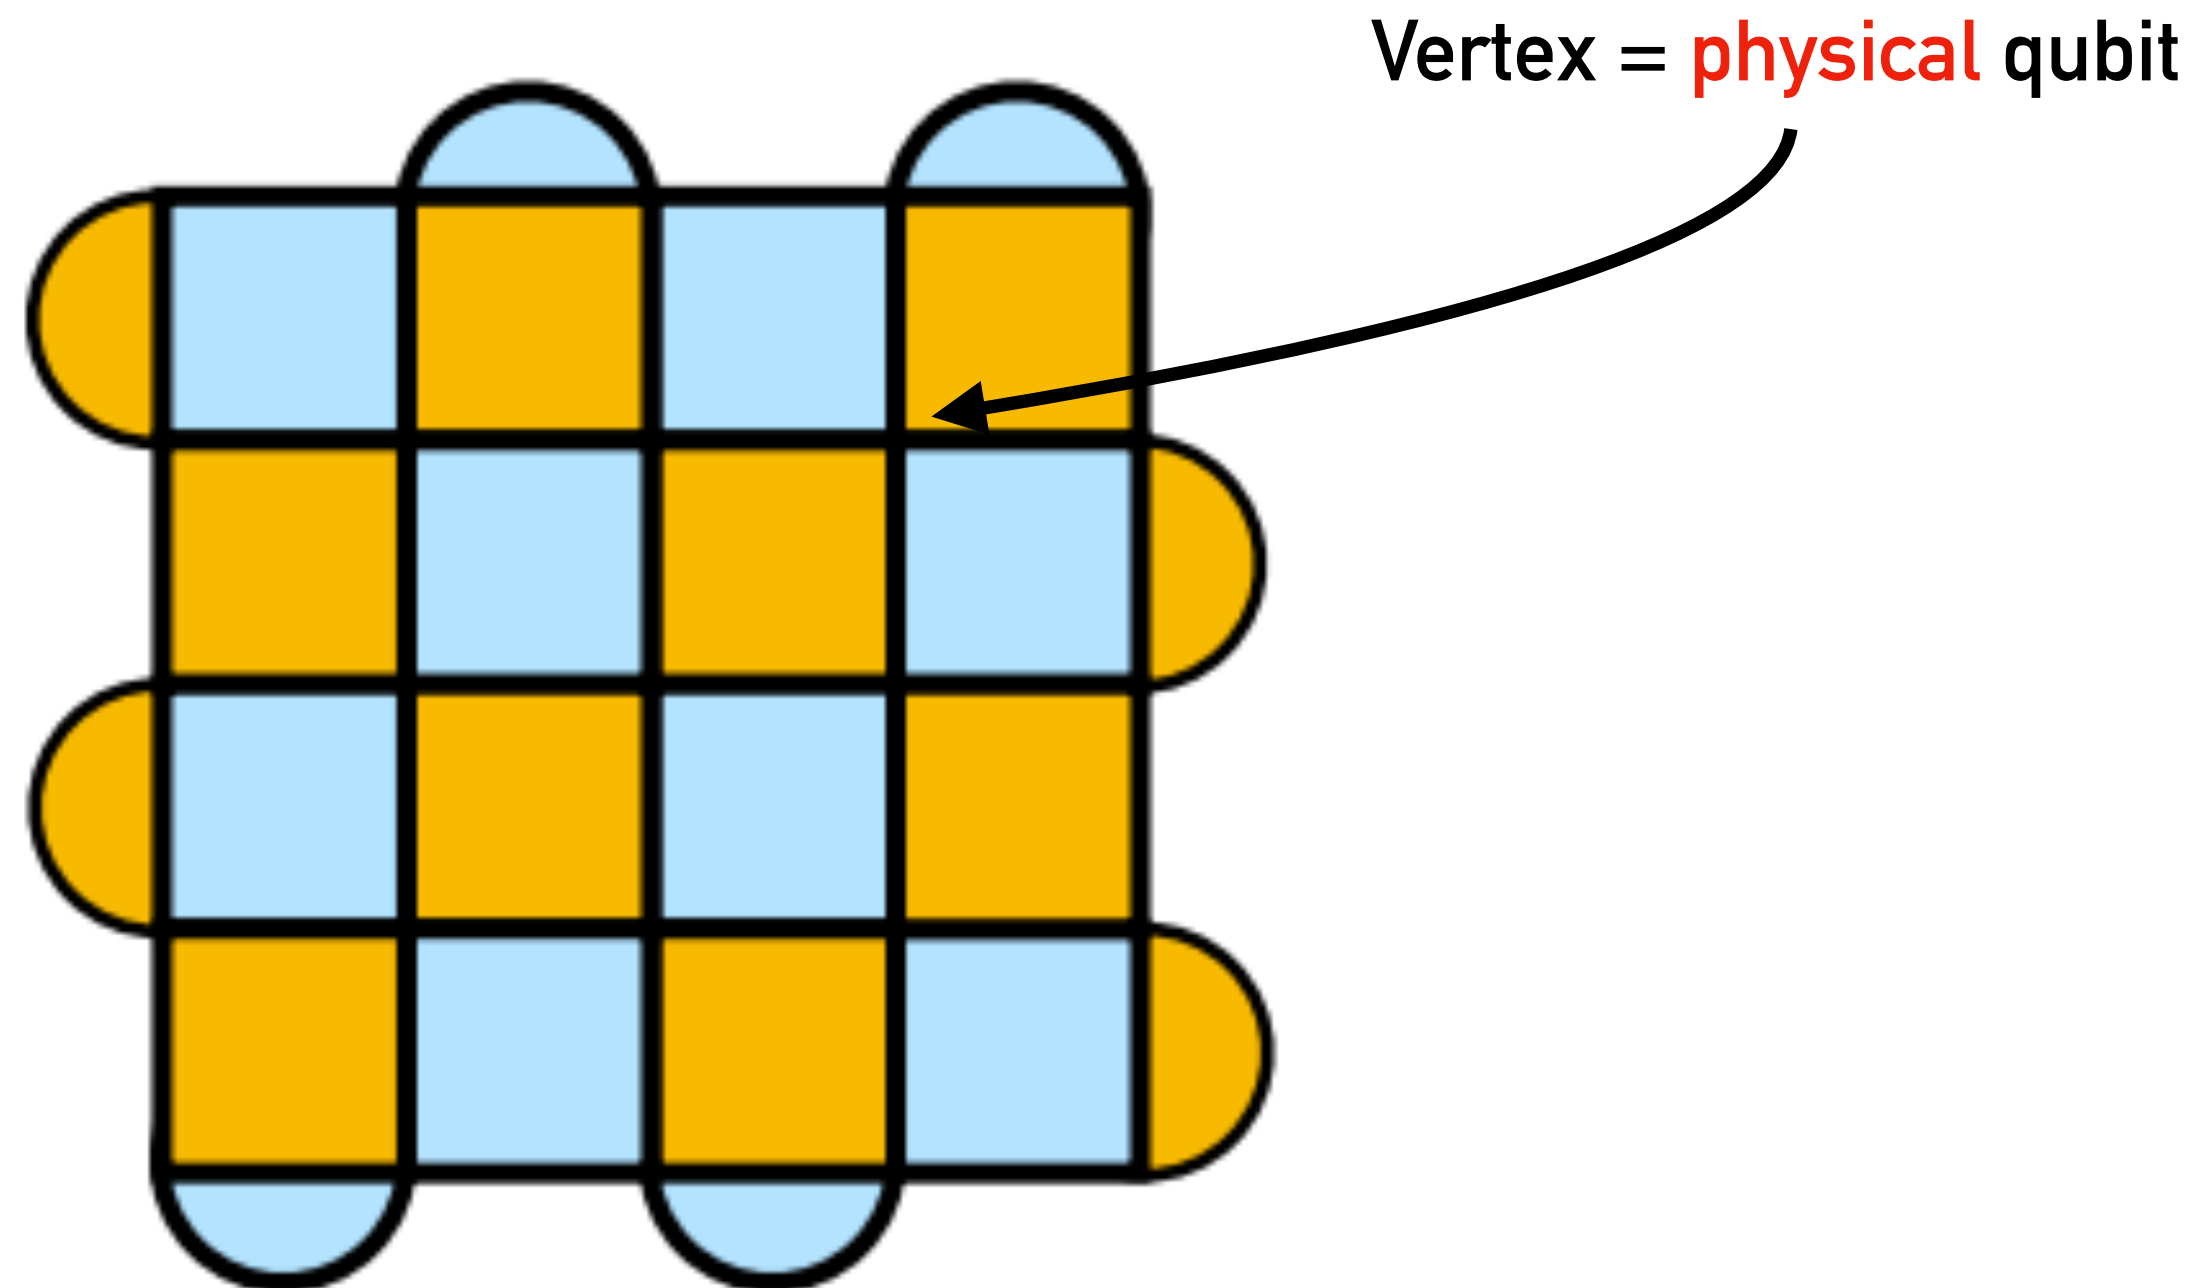

Image Credit: DeepMind

# A simple quantum computer with one **logical qubit**

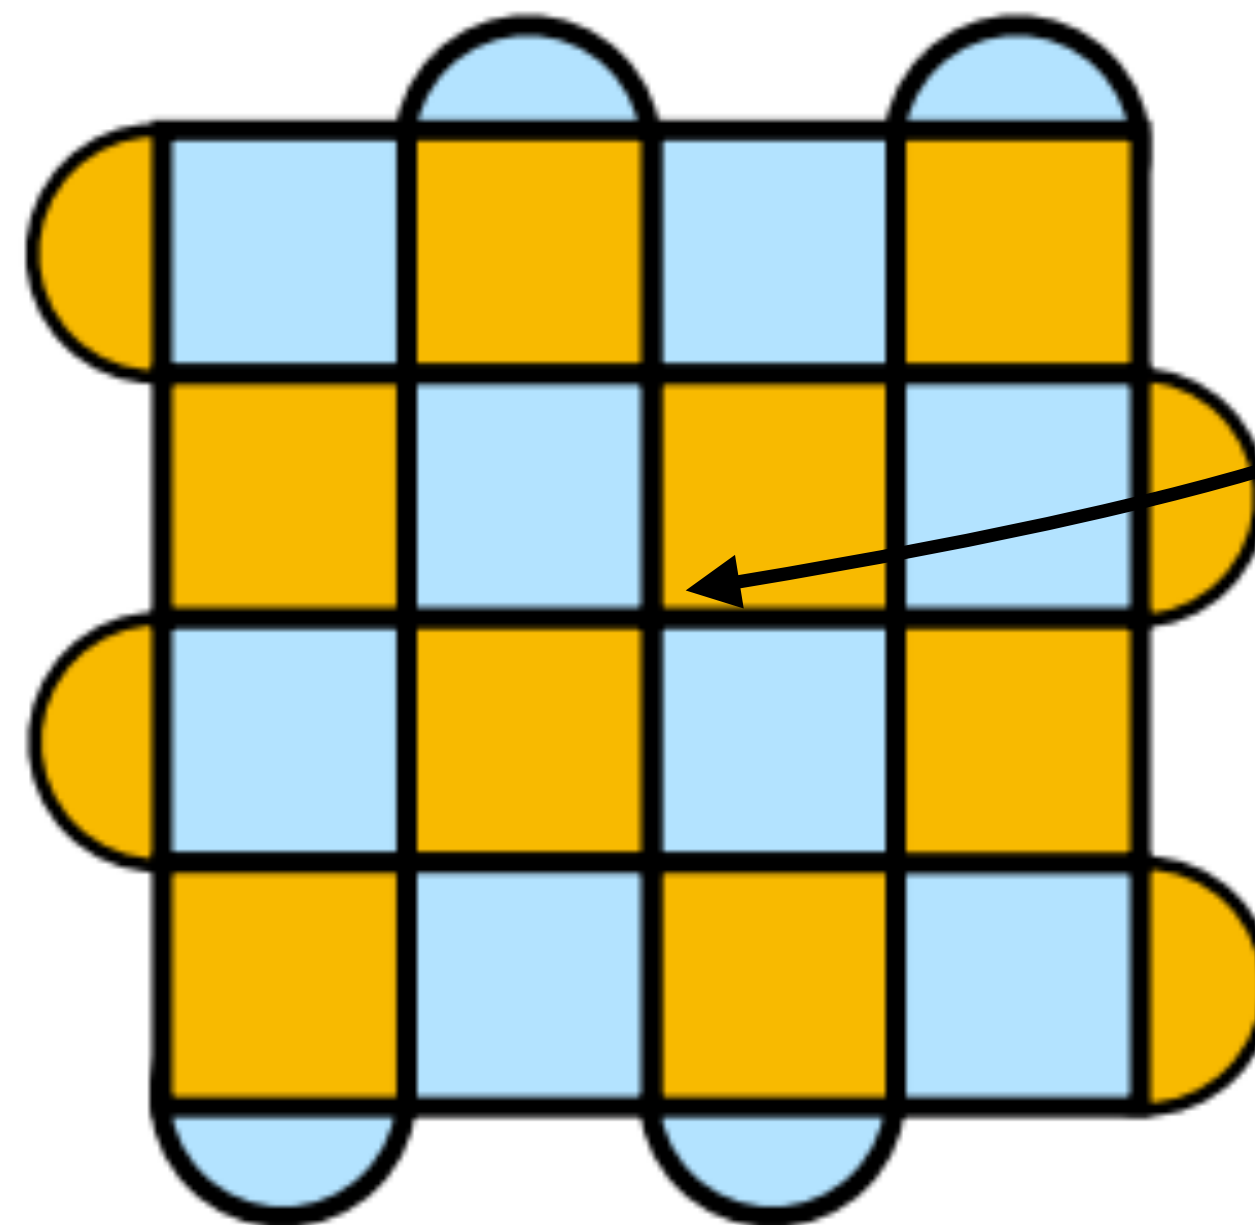

# A simple quantum computer with one **logical qubit**

The full state of all these qubits itself represents a “**logical**” qubit

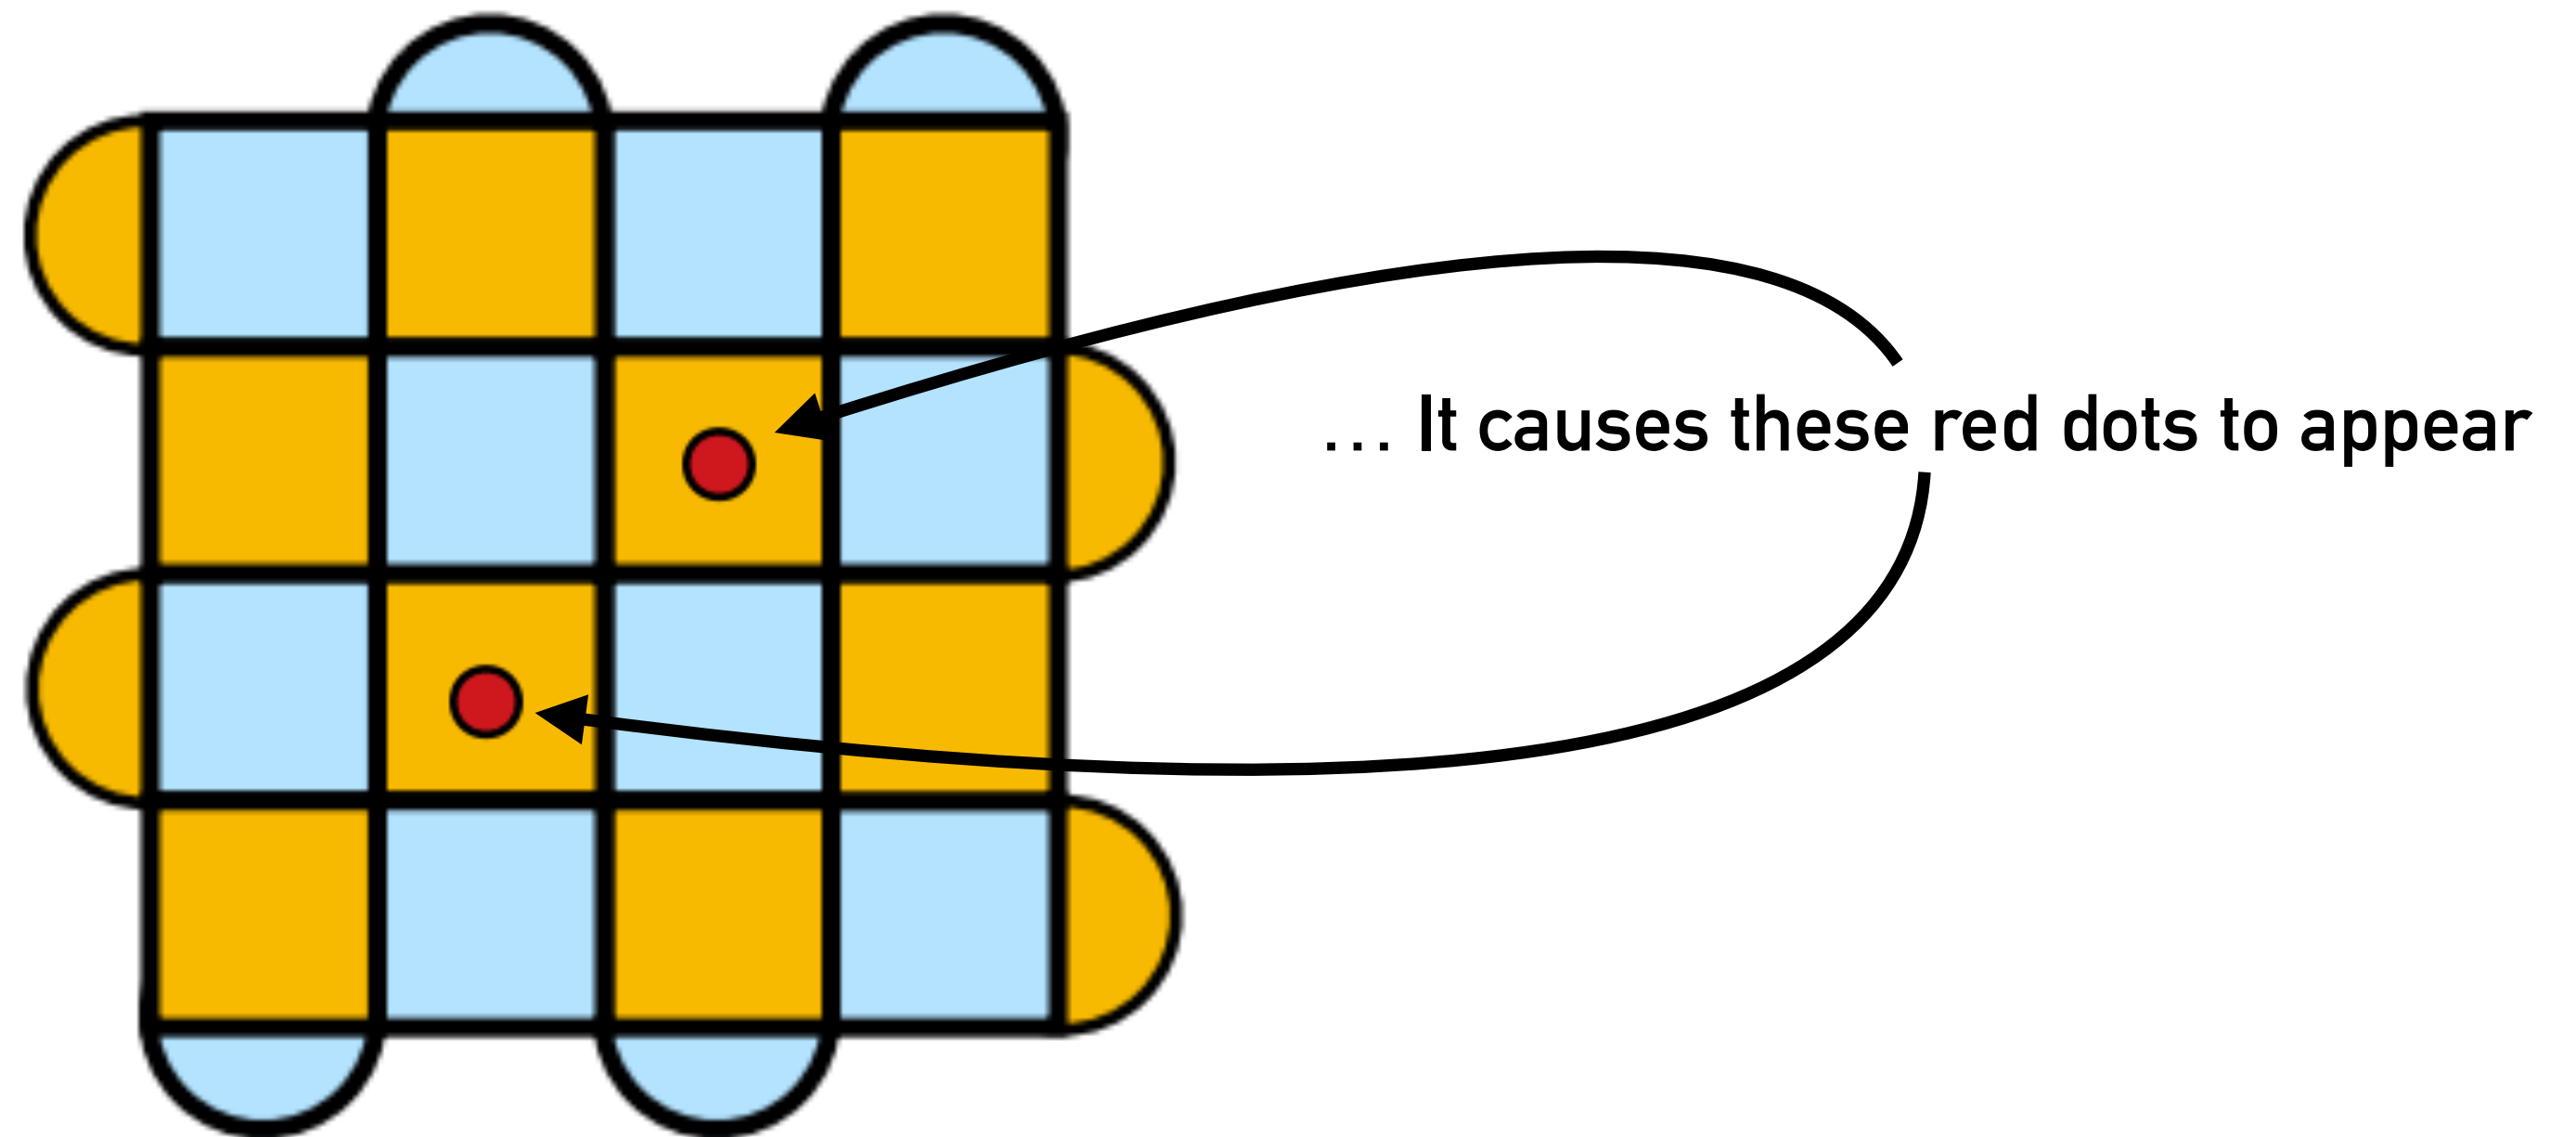

Simplification: all **qubits** 0 -> **logical** 0, all **qubits** 1 -> **logical** 1

Qubit errors show up as **red dots** on the orange squares

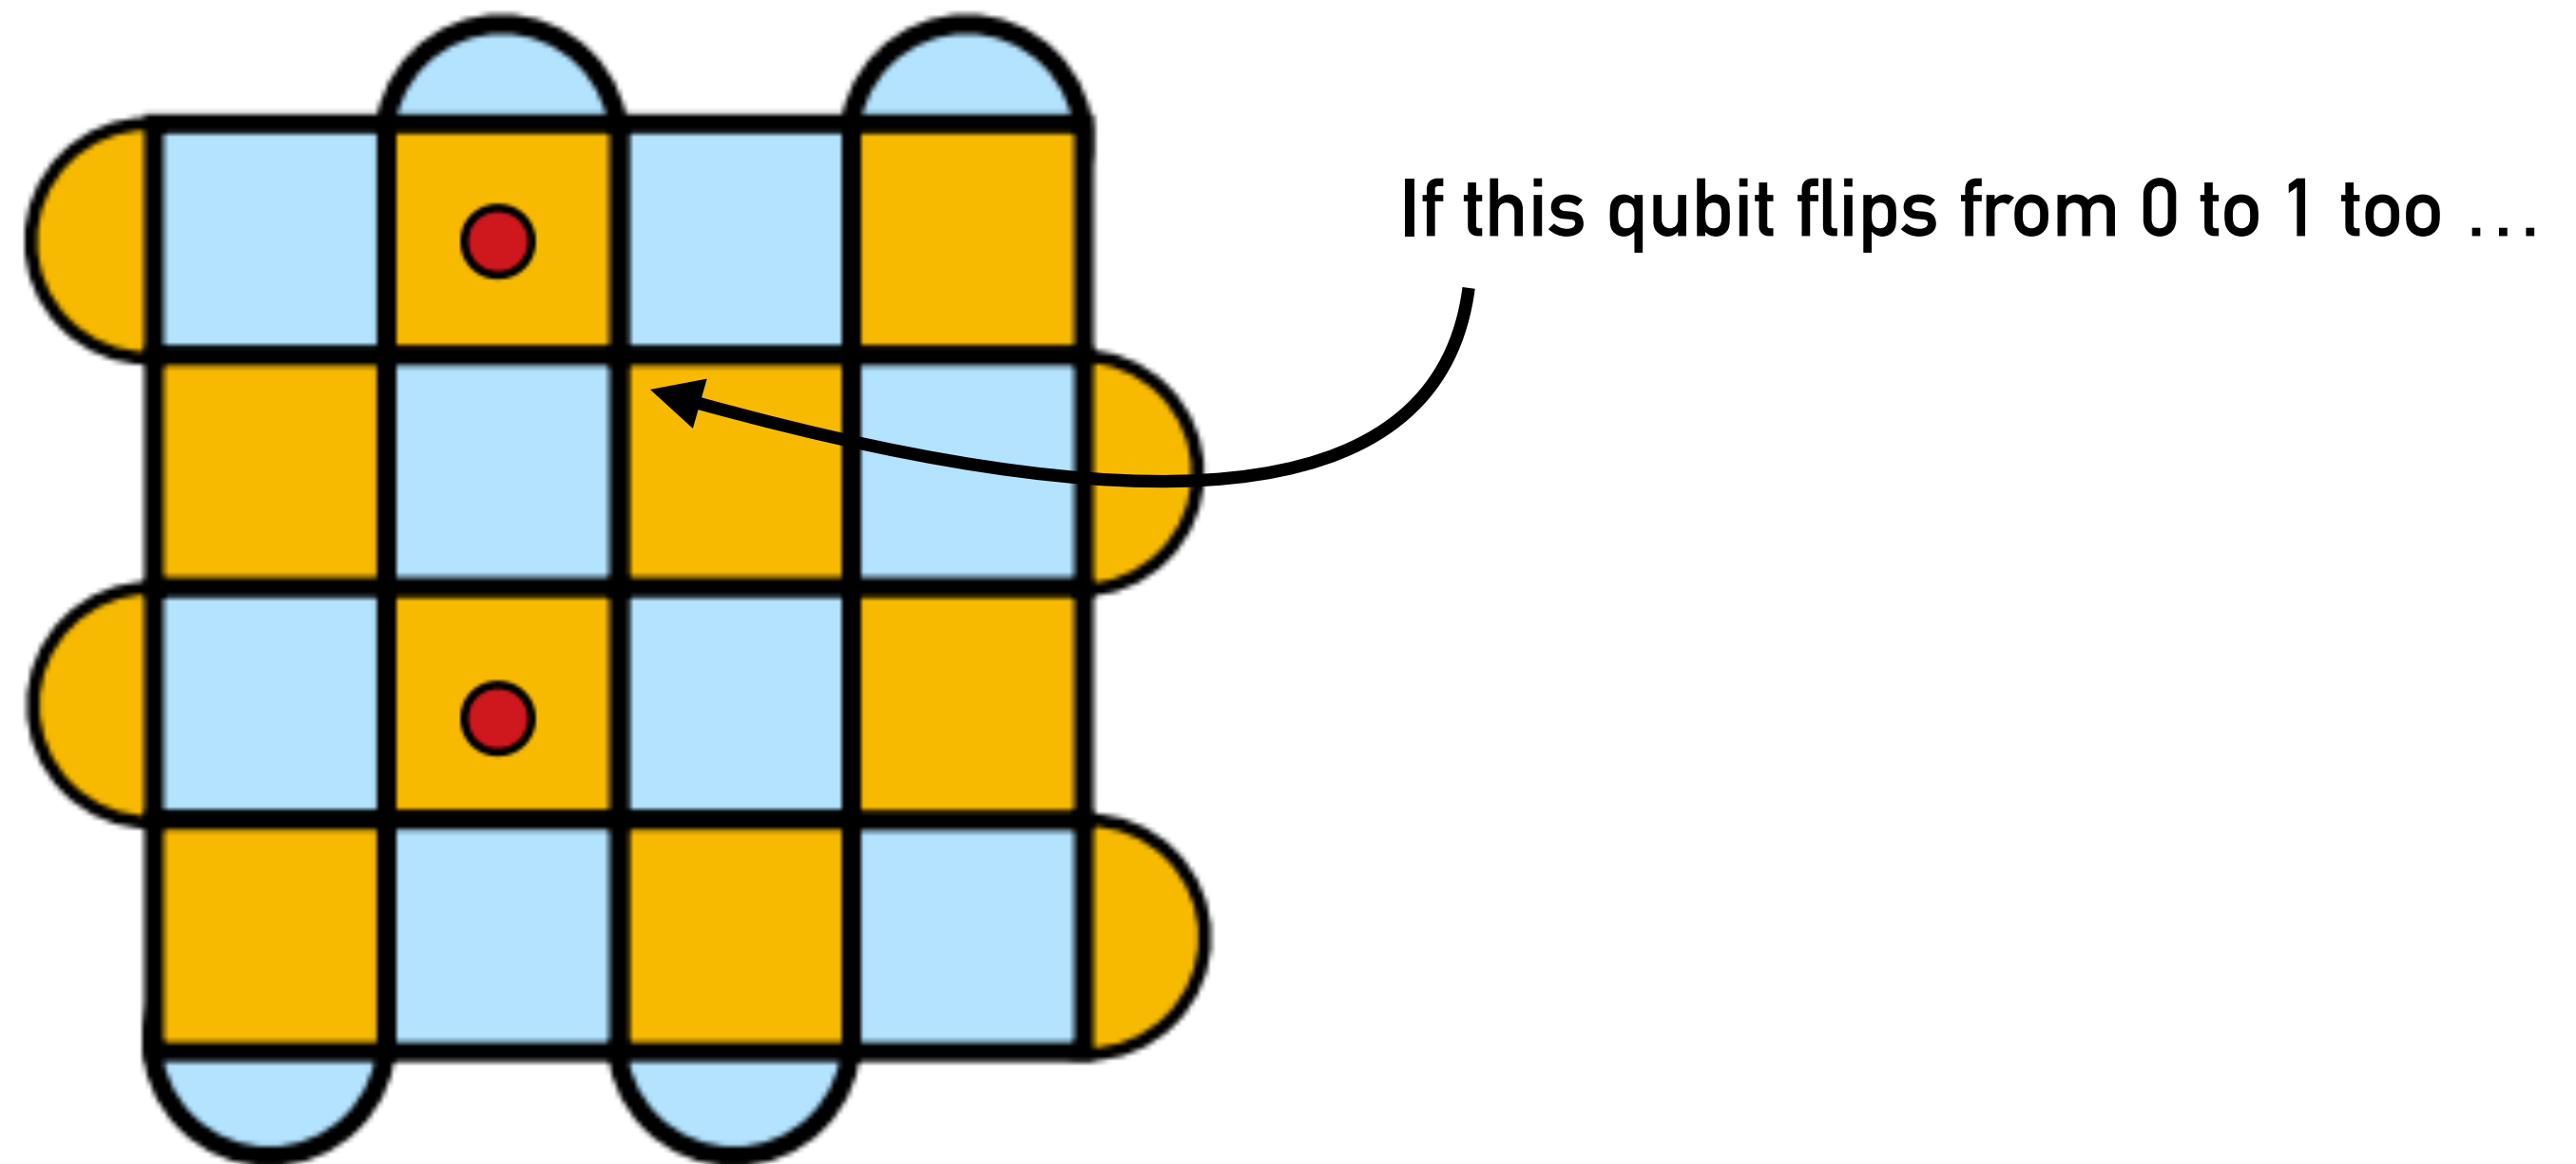

If this qubit flips from 0 to 1 ...

Qubit errors show up as **red dots** on the orange squares

We can not look at the flipped qubits, only the red dots!

# Multiple errors cause red dots to change position

Only an **odd number of red flags** is visible

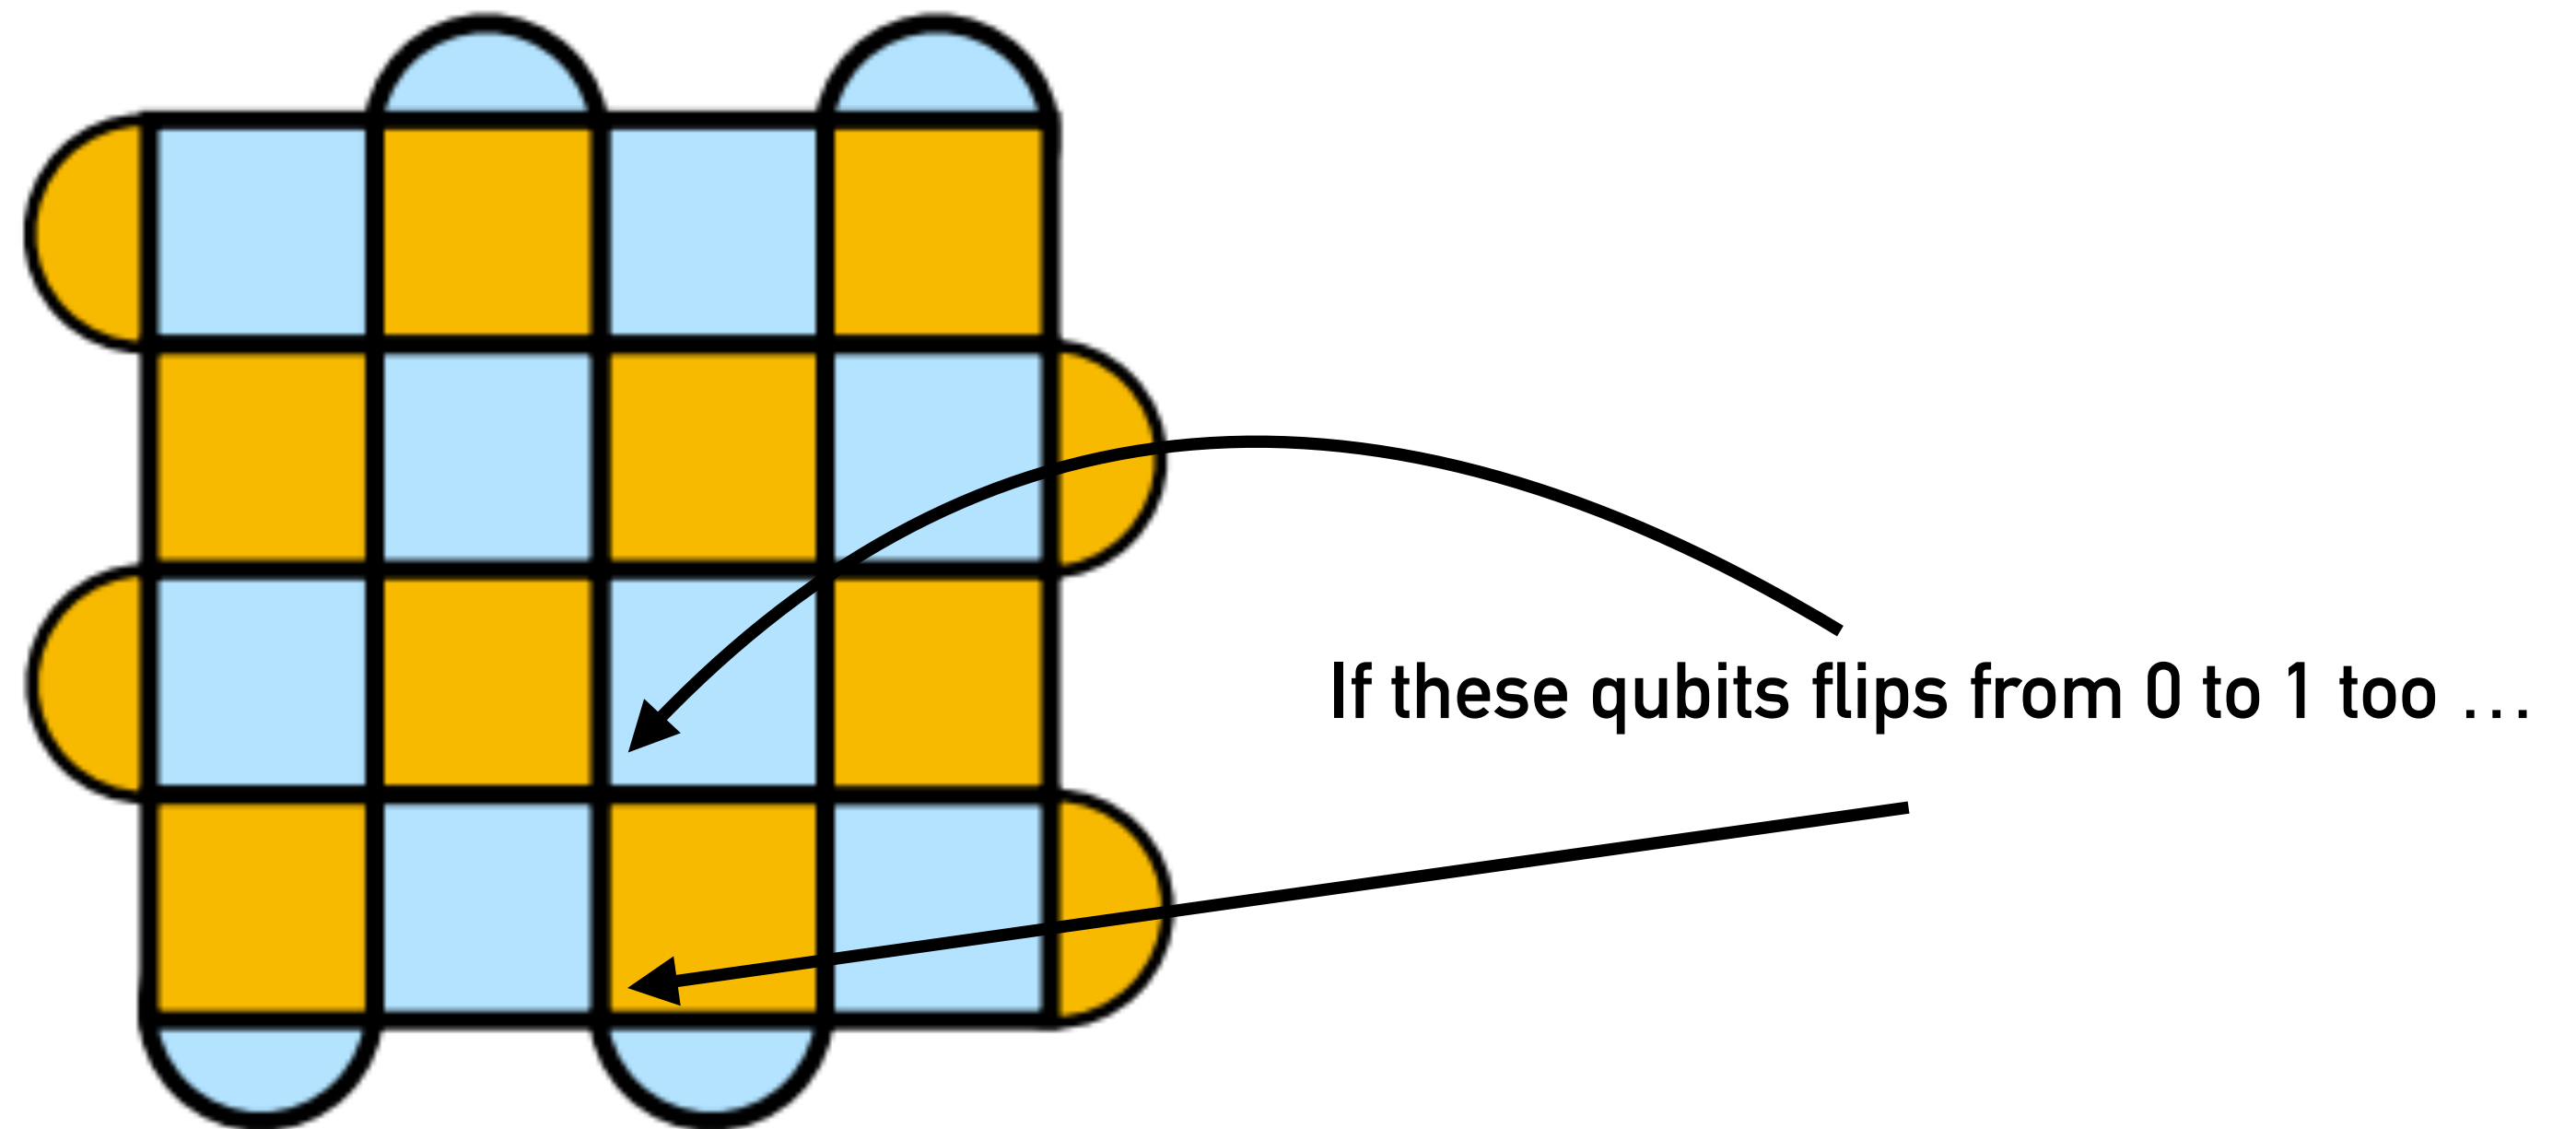

Red dots can (dis)appear at the edges

If this qubit flips from 0 to 1 too ...

**If a string of errors connects the edges, it is impossible to find out which qubits had errors**

**A whole column of qubits has errors, but we can't see it!**

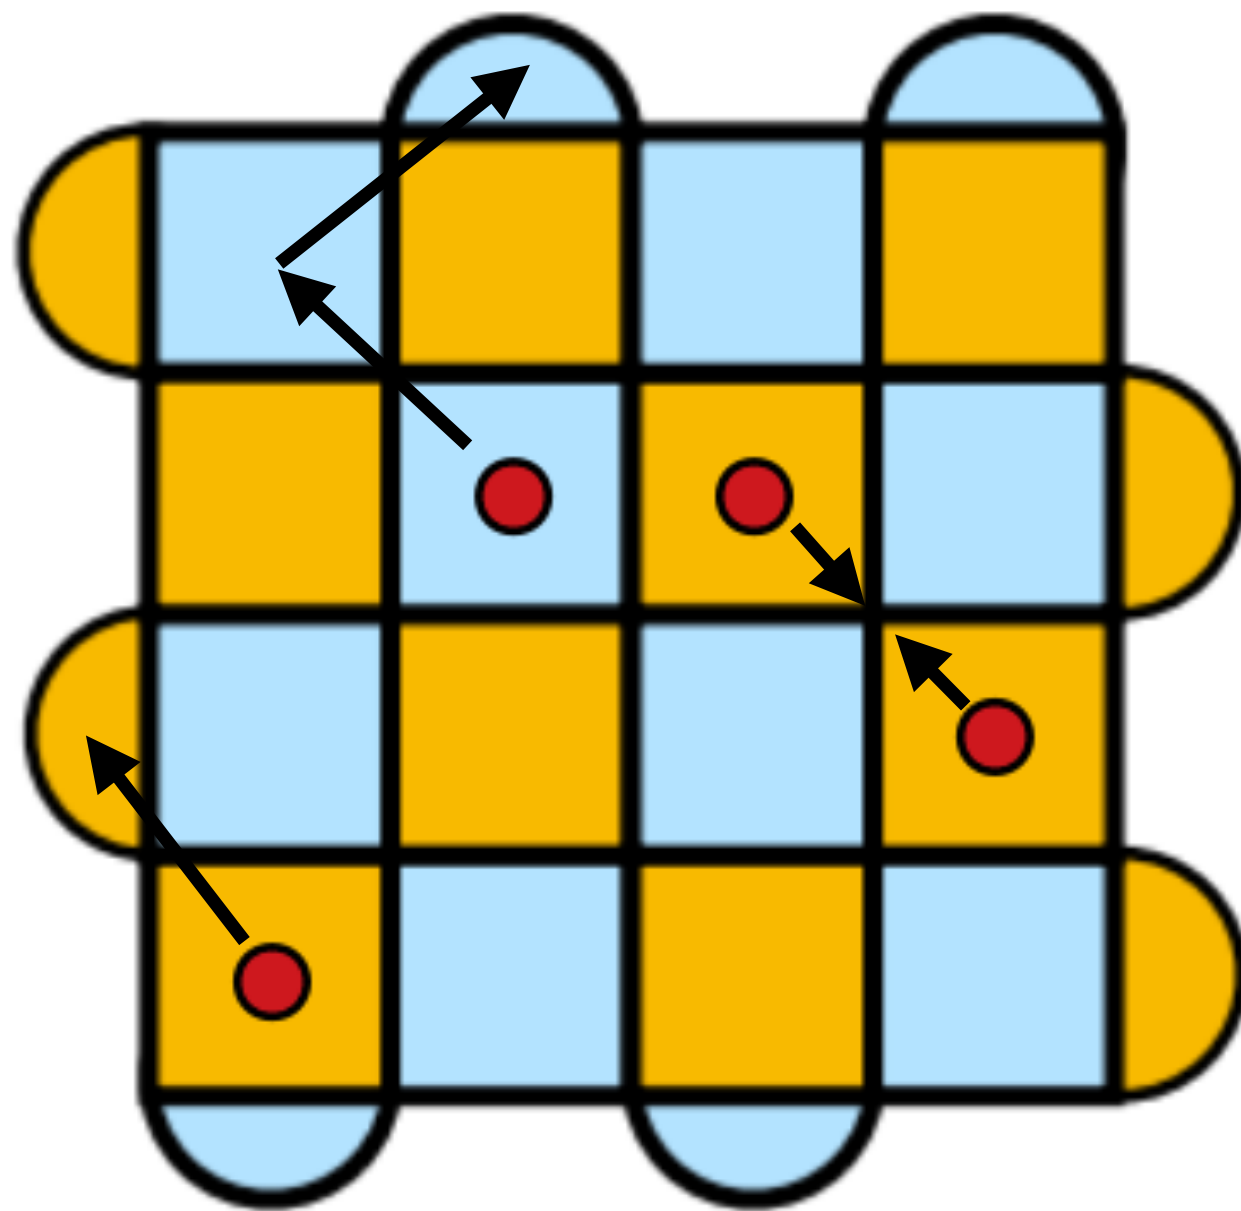

So **quantum error correction** is like a board game!

**Given red dots, find out which qubits flipped (the errors)**

*Game over if a string of errors connects one edge to the other*

# Reinforcement learning can do quantum error correction

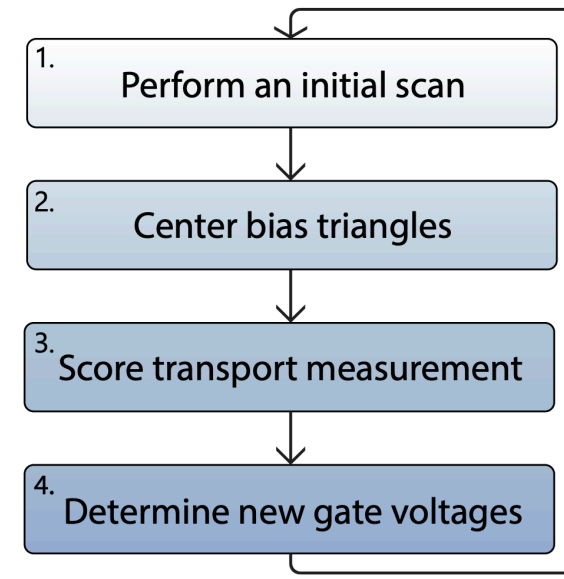

Use a neural network to determine which qubits flipped, given the current red dots

# These methods are **not mutually exclusive**

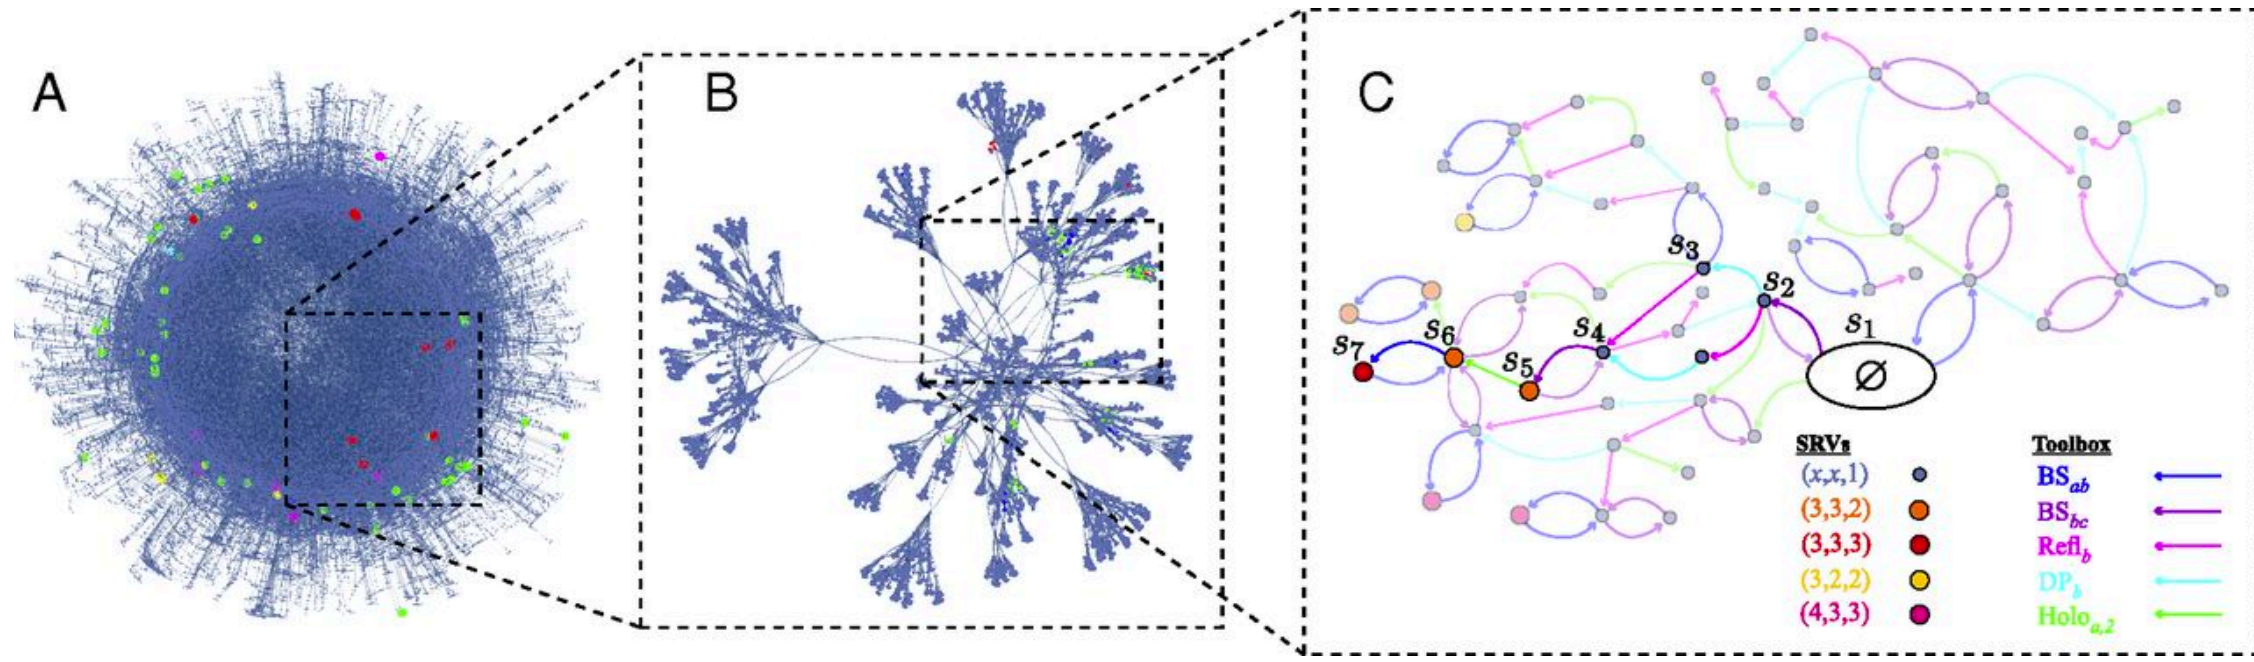

A glimpse of the future?

Control experiments

Natalia Ares' Lab, [arXiv:2001.04409](https://arxiv.org/abs/2001.04409)

Design experiments

Melnikov et al, PNAS February 6, 2018 115 (6) 1221-1226

# When does an ML approach make sense in physics?

~~Accuracy~~

Only ever as accurate as the data (unless ML can also request new data?)

Speed

Experimental/Computational Cost

Predict ground state properties vs Monte Carlo, or learn a quantum state

[quantummanybody.webflow.io](http://quantummanybody.webflow.io)

Deep Convolutional Network (DCN)

Adaptiveness

If qubit number 37 happens to be worse than the others, ML will learn that

# Quantum Games

## Quantum Computing in the NISQ era and beyond

John Preskill

### 6.11 Quantum games

Advances in classical computing launched a new world of digital games, touching the lives of millions and generating billions in revenue. Could quantum computers do the same?

Physicists often say that the quantum world is counter-intuitive because it is so foreign to ordinary experience. That's true now, but might it be different in the future? Perhaps kids who grow up playing quantum games will acquire a visceral understanding of quantum phenomena that our generation lacks. Furthermore, quantum games could open a niche for quantum machine learning methods, which might seize the opportunity to improve game play in situations where quantum entanglement has an essential role.
